

1. The twenty-third letter and eighteenth consonantsign in the English alpha-

and eighteenth consonantsign in the English alphabet. It has a double value, as
consonant and as vewel. As an
alphabetic character it is of very
modern date, being one of the four
that have aprung from the V or V
added by the Greeka to the older
Phenician alphabet, and one of the
three (U, V, W) that have grown ent of the Roman form
of that character (see U). It was made (as pointed ent
under U) by doubling the U- or V-sign (hence called double
U), in order to distinguish properly the semivewel sound
w from the spirant v and the vowel u. It was formerly
often printed as two V's, V', vr. It began to be used in
the eleventh centry, and gradually crowded out the special sign for the same sound which the Anglo-Saxon alphabet had possessed. The alphabetic sound distinctively
represented by w is the labial semivowel, which stands is
precisely the same relation to oo (6) in which consonantal y stands to ee (6). Each of these aemivowels, if not of
precisely the same mode of production with the cerresponding vowel, is at any rate only very slightly different
from it; va is virtually an ow which is abbreviated into a
mere prefix to another vowel, a close position from which
the organs by opening reach another vowel-sound; and a
prolonged w is an oo. On the other hand, the semivowel
(Ilke the semivowel y) can.be only very imperfectly and
indistinctly intered after a vowel, and our w in that position is but snother way of writing u; it is found only in
the combinations and, ev, on, which are equivalent to au,
ev, ou; and as so used it could disappear from the language without any loss, but rather with profit. The semivowel sound w (including wh and qu, which is a way of
writing kro: see under Q) is a not uncommon element of
English utterance, being about 2½ per cent, of it (a littie
less than the apirant o). In many languages—for example, m all those that are descended from the Latin
-the semitywel w tends to pass over into the spirant
v-sound, and hence the spirant value of our v, which was
the represe

etc., er the broad sound of a (A) as in war, quart, thwart, etc.

wage-fund, wages-fund (wāj'fund, wā'jez-fund), n. In polit. eeon., that part of the total productive capital of a country or community which is employed in paying the wages of la bor, as distinguished from the part invested in buildings, machinery, raw materials, etc. See the quotations.

bor, as distinguished from the part invested in buildings, machinery, raw materials, etc. See the quotations.

Wages, then, depend mainly upon the demand and supply of iabour, or, as it is often expressed, on the proportion between population and capital. By population is here meant the number only of the labouring class, or rather of those who work for hire; and by capital only circulating capital, and not even the whole of that, but the part which is expended in the direct purchase of lahour. To this, however, must be added all funds which, without forming a part of capital, are psid in exchange for Isbour, such as the wages of soldiers, domestic servants, and all other unproductive labourers. There is unfortunately no mode of expressing by one familiar term the aggregate of what may be called the vages-fund of a country; and, as the wages of productive labour form nearly the whole of that fund, it is usual to overlook the smaller and less important part, and to say that wages depend on population and capital. It will be convenient to employ this expression, rememberiog, however, to consider it as elliptical, and not as a literal statement of the entire truth.

J.S. Mill, Pol. Econ., II. xl. 1.

As I understand this passage [from Mill's "Pol. Econ."], it embraces the following statements: lat, Wages-fund is a general term, used, in the absence of any other more familiar, to express the aggregate of all wages at any given time in possession of the laboring population; 2nd, on the proportion of this fund to the number of the laboring population depends at any given time the average rate of wages; 3rd, the amount of the fund is determined by the amount of the general wealth which is applied to the direct purchase of labor, whether with a view to productive or to unproductive employment. If the reader will carefully consider these several propositions, I think he will perceive that they do not contain matter which can he property regarded as open to dispute. The first is littie more than a definition. The second their hands.

Wagnerism (väg'ner-izm), n. [< Wagner + -ism.] 1. The art theory of Riehard Wagner, especially as concerns the musical drama, including the general style of composition based eluding the general style of composition based on that theory. Among the many characteristics of the theory are these: the choice of a general subject in which the mythical and heroic elements are prominent; the amalgamation of poetry, music, action, and scenic effect into the most intimate union as equally important coöperating elements; the desertion of the conventionalities of the common Italian opera, especially of its sharply defined and contrasted movements and its tendency to the display of mere virtuosity; the abundant use of leading motives as a means to continuous and reiterated enotional effect; the immense elaboration of the orchestral parts, so that in them is furnished an unbroken presentation of or commentary on the entire plot; and the free use of new and remarkable means of effect, both seenic and instrumental. The Wagnerian ideal is often called (sometimes derisively) "the music of the inture," from the title of one of Wagner's essays. While Wagnerism is best exemplified in the great dramas of Wagner himself, its qualities may be seen more or less in almost alt the dramatic music of the last half of this century.

B. Jonson, Staple of News, ti. 1.

The act of watching or keeping vigil, especially for a solemn or festive purpose; a vigil; specifically, an annual festival kept in commemoration of the completion and dedication of a parish church; hence, a merrymaking; a festive gathering. The wake was kept by an alt-night watch in the church. Tents were erected in the church yard to supply refreshments to the crowd on the following day, which was kept as a holiday. Through the large attendance from neighboring parishes at wakes, devotion and reverence gradually diminished, until they uitimately became mere fairs or markets, characterized by merrymaking and often disgraced by indulgence and riot. In popular usage this word has the same meaning as vigit. The wake or revel of country parishes was, originally, the day of the week on which the church had been dedicated; afterward, the day of the year. In 1536 an act of convocation appointed that the wake should be held in every parish on the same day, namely, the first Sunday in Octoher; but it was disregarded. Wakes are expressly mentioned in the "Book of Sports" of Charles I, among the feasts which should be observed. The wake appears to have been also held on the Sunday after the day of dedication; or, more usually, on the day of the saint to whom the church was dedicated. In Iretand it is called the patron day. Quoted in Hone's Year Book, col. 958.

An all-night watch by the body of the dead, 3. An all-night watch by the body of the dead, before burial. This custom seems to be of Celtic origin, and is now characteristic of Ireland, or of the Irish in other countries; but it was formerly observed in Scotland and Wales. It probably originated from a superstition that the body might be carried off by invisible spirits, or from a more rational fear of injury to it from wild heasts. In early literature it has the name of likewake, lichwake. The wake was originally a combination of mourning for the dead and rejoicing in his memory and for his deliverance, but in later times has often degenerated into a scene of wild grief and gross orgies. See likewake.

How that the liche-wake was y-holde Al thitke night. Chaueer, Knight's Tale, l. 2100.

The late-wake is a ceremony used at funerals. The cvening after the death of any person, the relations and friends of the deceased meet at the house, attended by a bagpipe or fiddle; the nearest of kin, be it wife, son, or daughter, opens a melancholy bail, dancing and greeting, i.e. crying violently, at the same time; and this continues till daylight, but with such gambols and frolies among the younger part of the company that the toss which occasioned them is often more than supplied by the consequences of that night. If the corpse remain unburied for two nights, the same rites are renewed.

The walnut-tree is native from the Caucasus and Armenla to the mountains of northern India, and is extensively cultivated, and in some places naturalized, in temperate Europe. It grows from 40 to 60 or even 100 feet high, with a massive trunk and hered.

massive trunk and broad spreading top, and bears pin-nate leaves with few smooth leaf-lets. It produces the well-known sweet-acceded nuta sweet-aeeded nuta of this name, in America distinguished as English walnuts. These are surrounded with a thin, brittle, and easily separated lusk. The shell is thin in different decrease or in the wild.

husk. The shell is thin in different degrees, or in the wild state thicker. The kernel yields some 50 per cent. of oil, which is largely expressed in France and other parts of Europe, as also in Asia. That of the first pressing is used for food, like olive-oil, though ranked less highly; that of the second pressing, called fire-drawn, the cake having been submitted to boiling water, is more siccative even than linsed-oil, and hence is by some artists the most highly esteemed of all oils; it is a good lamp-oil, and is available for making soft-soap, etc. The whole fruit when quite young makes a good pickle. The shell of a large variety, called double wathrul, is used in France for making ontresse, casea for jewelry, etc. The leaves and the hull of the fruit are used in Europe for various medicinal purposes. Walnut-wood is light, tough, and handsome, plain or with a bur; before the introduction of mahogany it was the leading cabinet-wood of Europe, and is still preferred to all other wood for gunatocks.

Same as Indian walnut.—Black walnut, a North American tree, Jugtons nigra, or its timber. The tree ranges, in rich bottom-lands and on hillaides, through a large part of the eastern half of the United States, but is becoming scarce. It grows from 90 to 140 feet high, with a trunk from 6 to 9 feet in diameter. The wood is heavy, hard, and strong, easily worked, and susceptible of a beautiful polish; it is purplish-brown when first cut, but becomes darker with age. It is more generally used for cabinet-making, inside finish, and gunstocks than any other North American tree. (Sargent.) The nuts are edible, but not very choice; the shell is hard, the husk thick and difficult to remove. The tree grows rapidly, and is more or less planted on the prairies.

Dan. hrulfisk: see whule and horsel. Cf. whale fish and narwhal.] Any member of the family Trichechidæ (or Rosmariday; a very large pinniped carnivorous mammal, related to the seals, having in the male-enormous canine teeth protruding like tusks from the upper jaw. The common walrus, T. rosmarus, the morse, sea-horse, sea-ox, or sea-cow, attains a total length of 10 to 12 feet in the full-grown male; individuals are reported to exceed 14 feet; a more nearly average length is 8 to 10 feet, with a girth of about as much. A weight of 2,500 to 3,000 pounds is acquired by old bulls, with a yield of 500 pounds of blubber. The whole length of the caoines is about 2 feet, when they are full-grown, with a projection of 15 inches or more. These teeth are used in digging for the clams which form the principal food of the animal, and in climbing over uneven surfaces of rock or ice. A walrus 12 feet long has the fore filippers 2 feet long by about 1 foot broad; the flukes each about this length, but 24 feet in extreme breadth when pressed out flat. The mammor of the female are two pairs, respectively abdominal and inguinal. Young and middle-aged individuals of both sexes are covered with a short coarse hair of a yellowiah-brown color, deepening into dark reddish-brown on the belly and at the bases of the limbs. Old animals, especially the bulls, become almost naked, and the skin grows heavily wrinkled and plaited, especially on the fore quarters. In the glacial period the walrus ranged in North America southward on the Atlantic coast to South Carolina. There is no evidence of its existence in New England since about 1550; from this date to 1600 it lived aouth to Nova Scotia. It now inhabits some parts of Labrador, shores of Hudson's Bay, Greenland, and arctic regions as far north as Eskinso live or explorers have gone. It has been found in Scotland of late years, and on or off the arctic coasts of Europe and Asia, especially in Spitzbergen and Nova Zembla. It is readily captured, and the systematic destruction to which it has long been subjected has materially diminished its numbers in many different places. The blubber yields a va maridæ); a very large pinniped carnivorous mammal, related to the seals, having in the

1. A round dance, probably of Bohemian origin, which has been extraordinarily popular since the latter part of the eighteenth popular since the latter part of the eighteenth century. It is danced by couples, the partners in each couple moving together in a series of whirling steps—either advancing continuously in the same direction, or varying this with "reversing" or turning the opposite way. The regular form of the waltz is known as the troistenus the more rapid form devactenus containing six steps to every two of the other. The derivation of the waltz is disputed, the French often claiming its descent from the volta, and the Germans from the allemande; but it is probably a development of the slow and simple landler. Its popularity has decidedly overshadowed that of all other fashionable dances.

Winthrop, Hist. New England, I. 143.

There was no currency, before this time, . . . unless we choose to give the name of currency to the wampunn, or vampumpeage (as it is more properly called), of the Indiana. . . Peage was the name of the substance, which was of two kinds—black and white. Wampunn, or vompunn, is the Indian word for white, and as the white kind was the most common, wampumpeage got to be the common name of this substance, which was usually abbreviated into vampunn. The black peage consisted of the small round spot in the inside of the shell, which is still usually called in this neighborhood by its Indian name of quahog. These round pieces were broken away from the rest of the shell, brought to a smooth and regular shape, drilled through the center, and strung on threads. The white peage was the twisted end of several small shells, Iroken off from the main part. These portions of shell, thus strung, were worn as bracelets and necklaces, and wrought into belts of curious workmanship. They thus possessed an intrinsic value with the natives, for the purposes of ornament; and they were readily taken by them in exchange for their furs.

(a) A legendary character who, according to one version (that of Mistthew Paris, dating from the thirteenth century), was a servant of Pillate, by name Cartaphilius, and gave Christ a blow when he was led out of the paiace to excention. According to a later version he was a cobbler named Ahasnerus, who refused Christ permission to sit down and rest when he passed his house on the wny to Golgotha. Both legends agree in the sentence prenounced by Christ on the offender, "Thou shalt wander on the carth till I return." A proy to remorse, he has since wandered from land to land without being able to find a grave. The story has been turned to account by many poets and novelists. The term seems to have been originally applied to the armed assemblies of freemen; and there is possibly an allusion to a practice of taking up or "touching" the arms. Wapentake is still a territorial division in Yorkshire.

It is written that King Allured, or Alfred, who then raigned, did devide the realme into shires, and the shires into hundrethes, and the hundrethes into rapes or vapentakes, and the vapentakes into tithinges, Soe that tenn tithinges made an hundrethe, and five made a lathe or vapentake.

Spenser, State of Ireland.

The vapentake is found only in the Anglian districts. . . To the north of these districts the shires are divided into wards, and to the south into hundreds. Hence the wapentake may be a relic of Scandinavian occupation.

wapiti (wop'i-ti), u. [Also wappiti, wapite, wapiti, wapite, < Amer. Ind. (Cree) wappitik, white deer,' said to designate the Rocky Mountain goat, Haploceros montanus; used as E., and also in the NL. form Cervus wapiti, by B. S. Barton, in 1809, for the animal defined.] The North American stag or elk, Cervus canadensis, which is the North American representative of the stag or red deer of Europe, and resembles the latter, though it is much larger and of a stronger make, being one of the largest living representatives being one of the largest living representatives being one of the largest living representatives of the family Ceville. Wopht is chiefly a book-name of this deer, which has generally been known since about 1809 as the elk—a name applied in Europe to a very different animal, corresponding to that called moose in North America. (See elk! (with ent), moose, step.) The full-grown male wapit may exceed a height of 16 hands at the withers, and acquire a weight of more than 1,000 pounds, though not averaging over 600; the form is short for its stature. The coat is some shade of yellowish-gray or brownish-gray, darkening to chestnut-brown on the head, neck, and limbs, even blackening on the belly; on the rnoip is a white patch bordered with black and extending into the groin; the tail is extremely short. The antiers are very long, with comparatively slender, cylindric, and regularly curved beam, giving off in front the brow- and bez-antiers close together, the royal at end of first third

of the beam, a large sur-royal at end of second third, and then forking dichotomously (only exceptionally acquiring any palmation like the crown of the Enropean stag). A pair of good-sized antlers may weigh, with the skull, 50 or 60 pounds, measure 4 or 5 feet along the curve of the beam, and spread 3 or 4 feet apart. The venison is well flavored and highly nutritious. The wapiti has inhabited North America from the Atlantic to the Pacific, and from Mexico to about 57° in the interior; but it has been hunted out of nearly all its range, and is now found chiefly in the Rocky Mountain region of the United States, especially of the Upper Missouri and Yellowstone rivers. It is gregarious, goes in herds or droves sometimes of many hundreds, is slaughtered with little difficulty, and would soon become extinct were no measures taken for its preservation.

The F. guerre appears in the phrase nom de guerre, and the Sp. in the dim. guerrilla. Hence war¹, v., warray, warrior, etc.] 1. A contest beween nations or states (international war), or between parties in the same state (civil contest between nations or states (international war), or between parties in the same state (civil war), carried on by force of arms. International or public war is always understood to be authorized by the sovereign powers of the nations engaged in it; when it is carried into the territories of the antagonist it is called an aggressio or offensive war, and when carried onto resist such aggression it is called defensive. Certain usages or rights of war have come to be generally recognized and defined under the name of the Laws of War, which in general (but subject to some humane restrictions which in recent times have been greatly increased) permit the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. On the other hand, though an enemy may be starved into surrender, wounding, except in battle, nutrilation, and all cruel and wanton devastation are contrary to the usages of war, as are also bombarding an unprotected town, the use of poison in any way, and torture to extort information from an enemy: but it is admitted that an enemy may be put to death for certain acts which are in themselves not crimial, and it may be even highly patriotic and praiseworthy, but are injurious to the invaders, such as firing on the invaders although not regularly enrolled in an organized military force, or seeking to impair the invaders' lines of communication.

2. Specifically, any one of a great number of small oscine passerine birds, or dentirostral insessorial birds, of different families and many different genera, of both the Old World and the insessorial birds, of different families and many different genera, of both the Oid World and the New. Especially—(a) A bird of the group composing the family Syltviidæ, or Oid World warblers, with scarcely any representatives in America. This is one of the most extensive and varied groups of its grade in ornithology, now generally rated as only a subtamily (Syltviinæ) of Turdidæ. These warblers are all small, active, sprightly birds, and many are remarkable for the clearness, sweetness, and flexibility of their song. Among typical warblers of the subtamily Syltviinæ may be noted the species of Sylvia, the leading genus, as the blackcap and whitethroat; of Melizophilus, as the Dartford warbler; of Regulus, as the goldcrest; of Phylloscopus, as the willow-warbler; of Actocephalus, as the reed- or sedge-warbler; of Locustella, as the grasshopper-warbler; of Cettia, as Cettis warbler. Besides these, the accentor or hedge-sparrow, the nightingale (Daulias luscinia), the reubreast (Erythacus rubecula), the bluethroat, redstart, whinchat, stone-bler, as nembers of the sylviine group. (b) In the United States, a bird of a different family, the American warblers, Dendrecidæ or Miniotilidæ, a smaller and more compact group than the Sylviidæ, though the species are still very numerous and diversified. Few of them are noted for musical sbility. The leading representatives of the American warblers are the numerous wood-warblers of the genus Bendreca; the worm-eating warblers, Melminthophaga; the creeping warblers, Miniotilia and Parula; the ground-warblers, as Geothlypis; the chat, Leteria; the water-thrushes, Seiurus; the tly-catching warblers, Mylodoctes, Setophaga, and many others of tropical America.

9. In mining, metal., etc., to separate from the earthy and lighter matters by the action of water: as, to wash gold; to wash ores. Washing is a common expression used in the most general way, as nearly an equivalent for ore-dressing, or the separation of ore from the gangue with which it is generally mixed. The term washing is, however, more especially nised to designate the separation of gold from the detrital formation in which it so frequently occurs. The same term is also commonly employed to designate the process of separating coal from various impurities which frequently occur intermingled with it, such as shale, pyrites, argillaceous iron ore, gypsum, etc. The machines by which this is done are called coal-washers, as machines for washing gold are called coal-washers. Washing is also the term in general use for designating the operation of cleansing the ore when, as is frequently the case, it comes from the mine mixed with clay or dirt (material which cannot properly be called gangue). This is a coarse operation, which is sometimes a necessary preliminary to the operations of sizing and dressing, or concentrating, as sometimes called.—To wash one's hands of. See hand.

The act of cleansing with water; ablution. Ceremonial washing has been practised in ancient and modern times and among various peoples. The principal ceremonial washings in the modern Christian church are two: washing of feet, in commemoration of the washing of the feet of the disciples by Christ (see foot); and washing of the hands, especially in connection with the celebration of the encharist. In the Western Church, as well as in the Greek and other Oriental churches, the priest washes his hands before celebration. In the Western Church he also washes his fingers after the offertory and at the end of the eucharistic office. See ablution, lavabo, purification, and holy water (under water).

washing-machine (wosh'ing-ma-shēn"), n. An apparatus, operated by hand or steam-power, for washing elothing, fabrics, wool, or other material; a clothes-washer. Washing-machines for domestic and laundry use have been made in the form of churns, rubbing- or beating-machines, and tumbling-boxes. While a great variety of machines have been introduced, all depend essentially upon some mechanical device for stirring and beating the clothes in a vessel containing hot soapy water. Rubbing the clothes against a ribbed surface under water appears to be the most common method. For bloacheries and mills where large quantities of fabrics are to be washed, the material is made up into continuous bands, and is drawn throngh vats over rollers. In some machines heaters are used to assist in cleaning the fabrics. Such machines are of the nature of bucking-machines, keirs, wincing-machines, and dash-wheels. Washing-machines are designed to be used with wringers. One form for domestic use is practically a form of wringer, the clothes being cleaned by drawing them between rollers of corrugated rubber.

Washingtonia (wosh-ing-tō'ni-ä), n. Washingtonia (wosh-ing-tō'ni-ä), n. [NL. (Wendland, 1879), named after George Washington (1732–99), first President of the United ington (1732–99), first President of the United States.] A genus of palms, of the tribe 'org-phæ. It is characterized by bisexual flowers with slightly imbricated segments, and a three-lobed ovary with elongated filiform style. The albumen of the seed is uniform, like that of the related genera Corppha and Sabot, but the embryo, unlike the others, is sub-basllar. There is but one species clearly known, W. filifora, mative of southern California and the adjacent border, called desert-palm, and locally fan-palm and San Diego palm. It produces a tall robust cylindrical trunk, enlarged at the base, often 40, sometimes 75, feet high, crowned by a cluster of light green circular plicate leaves with from 40 to 60 folds about 4 feet across, cleft nearly to the middle into induplicate segments fringed with fine white penduWashingtonia

lous threads often a foot long. The stout leafstalk ends in a large appressed ligule, is about 8 feet long, and is set with strong, hooked spines along its edges. The mature tree bears in June three or four smooth clongated paniculate spadices with very many slender flexious branchlets. The small dry flowers are white, sessile, and persistent without change, the corona salver-shaped with a fleshy tube and sharp lanceolate lobes, and the six projecting stamens have large filaments and authers. A single spadix 8 feet long hangs pendent at ripening, In September or October, bearing about ten pounds of small black ellipsoidal one-celled fruits, each with a single shining brown bony seed surrounded by a thin sweetish pulpy pericarp. This is the only arhorescent palm in the United States far from the sea; it occurs there chiefly in the desert in San Diego county, California; in Lower California it approaches the coast. It was discovered by Dr. C. C. Parry, 1849-50; it is now frequent in entivation, especially along the Californian coast, often under the name of Pritchardia flamentosa or Brahea flifera; when very young, it is valued in America as a house-plant. Since 1875 it has been grown by thousands along the Mediterranean near Nice for outdoor decoration, where the characteristic appearance after twelve years growth is that of a huge bulbous trunk, often 10 feet in girth and 10 feet high, bearing a crown of Ioliage 20 feet across, composed of from 50 to 80 white-fringed leaves. It vuries greatly in habit with age. It has been known to blossom at twenty-two years; one fifty years old was 58 feet high and 11 feet in girth. At maturity, its older leaves turn down, and cover the trunk with a dry thatch, a protection from the desert heat and winds, but burning so readily that it forms a source of danger from fire. The W. robusta of cultivation, peculiar in its reddish petiole-bases, is now considered a variety of the foregoing; If. Sonore of Mexico, with deep criuson-brown petioles and stem, is said to be

A fine white or light-yellow, very soft, and flexible leather, originally made from the skins of Rupicapra tragus, the Alpine chamois. Leather very closely resembling it in this properties is now made from skins of sheep, goats, decr, calves, and from split hides, the coarser qualities being known as wash-leather. The skins are limed to remove the hair, steeped in a weak solution of lactic or acetic acid to neutralize the lime, and then frizzed or rubbed with punice-stone or a blunk knife to remove the grain. Repeated fulling by pounding or rolling in oil, washing with weak alkaline solution to remove the oil, stretching, drying, and smoothing complete the process of manufacture.

Most wasps dig holes for themselves, whence they are also called Fossores (though not all are fossorial). There are 13 families of wasps: namely, Scoliidæ, Sapygidæ, Pompilidæ, Sphecidæ (or Sphegidæ), Larridæ, Nyssonidæ, Bembecidæ, Philanthidæ, Pemphredonidæ, Romande, and Vespidæ. The members of the first ten of these families are indiscriminately known as digger-wasps; those of the last three are wasps more strictly so called. The Masaridæ and Emmenidæ, like all the digger-wasps, are of solitary habits, and are hence known as solitary wasps (which see, under solitary). The Vespidæ alone are social wasps.

These are also called paper-wasps, from the character of their nests, and include the various species of Vespa known as hornets. Pepps, Diary, 11I. 410.

6. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the preeautionary setting of a watch is most generally necessary; period of time; hour. The Jews, like the Greeks and Romans, divided the night into military watches instead of hours, each watch representing the period for which each separate body of sentinela remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P. M.), the second or middle watch (10 P. M. to 2 A. M.), and the third, or morning watch (from 2 A. M. till sunrise). After the establishment of the Roman power they were increased to four, which were named as first, second, etc., or by the terms even, midnight, cock-revaing, and morning, these terminating respectively at 9 P. M., mildnight, 3 A. M., and 6 A. M.
7. Naut.: (a) The period of time occupied by each part of a ship's crew alternately while on duty. The period of time called a watch is four hours, eautionary setting of a watch is most generally

duty. The period of time called a watch is four hours,

6835
the reckoning beginning at noon or midnight. Between 4 and 8 P. M. the time is divided into two short watches, or dog-watches, in order to prevent the constant recurrence of duty to the same portion of the crew during the same hours. Thus, the period from 12 to 4 P. M. is called the afternoon watch, from 4 to 6 the first dog-watch, from 6 to 8 the second dog-watch, from 8 to 12 the first night watch, from midnight to 4 A. M. the middle watch, from 4 to 8 the morning watch, and from 8 to 12 noon the forenoon watch. When this alternation of watches is kept np during the 24 hours, it is termed having watch and watch, in distinction from keeping all hands at work during one or more watches. more watches.

After 2. or 3. watches more we were in 24. fadoms. Quoted in Capt. John Smith's Works, I. 112.

(b) A certain part of the officers and erew of a (b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two parts: the starboard veatch, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the port or larboard watch, which in the merchant service is commanded by the chief mate. In the British and United States navies these watches are commanded by the lientenants successively. The anchor-veatch is a small watch composed of one or two men appointed to look after the ship while at anchor or in port.

Shak, Rich, Ill., v. 3. 63, (b) A small portable timepiece or timekeeper that may be worn on the person, operated by power stored in a coiled spring, and capable of keeping time when held in any position. Watches were invented at Niiremberg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus Malvolio remarks in anticipation of his great fortune:

I frown the while; and perchance wind np my watch, or play with my - some rich jewel. Shak., T. N., ii. 5. 66.

The new contrivance of applying precious stones to watches I had the good fortune to see when Mr. Faelo, the inventor, and an ingenious man, and Mr. Debaufre, the workman, presented their watches, to have the approbation of the Royal Society.

See muster.—To stand a watch. See stand.—Watch and ward, the old custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between vatch and ward, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase to keep watch and ward, they implied a continuous and uninterrupted watching and guarding, constant vigilance and protection by night and by day.

Under ordinary conditions, therefore, water possesses the liquid conditions of the condition of the condition

The foreign matter in soft water is partly organic and partly mineral; in the latter a little silica is always present, as well as salts of potash, soda, lime, and magnesia. The impurities of hard water are varied in character, but carbonate of lime generally predominates. The mineral impurities of water are not necessarily delether one to health, even if present in somewhat large quantities. The contamination of water by organic matter (such as sewage, and the like) is a matter of great importance and often of great danger. Dead organic matter is rapidly oxidized by exposure to the air in flowing water, and ceases to be dangerous to health. The living organisms with which water is sometimes contaminated, in receiving the sewage of towns or in other ways, are sometimes the germs of deadly disease, and appear to possess a large amount of vitality, so that they can be conveyed for long distances without becoming disorganized, as Is the case with dead organic matter. High-water shrub, a shrubby composite plant, Iva frutescens, a native of the United Statea along the sea-coast from Massachusetts to Texas. Also called marsh-elder.—Holy water, water used for ritual purification of peraons and things; especially, water blessed by a Christian priest, and used to sprinkle upon persons or things, or to sign one's self with at entering church. Holy or lustral water has been used in almost all religions in purification of persons and things, especially in preparation for worahip, and also to drive away the powers of evil. Under the ancient Jewish law, the priests bathed their hands and feet in a laver before entering the tabernacle or approachahip, and also to drive away the powers of evil. Under the ancient Jewish law, the priesta bathed their hands and feet in a laver before entering the tabernacle or approaching the altar (Ex. xxx. 17-21, xl. 30-32), and the "water of purification" (Num. vili. 7, xix. 9, etc.) presents another analogy to Christian usage. The use of holy water in the Christian church is very ancient. In the Roman Catholic Church holy water is prepared every Sunday by evorcism and benediction of salt, and exorcism and benediction of the water, after which the salt is cast in the water, and both again bleased together. In the Greek Church the use of a holy-water stoop (colymbion) at the entrance of a church is almost obsolete. Holy water is used in the houses, and is blessed on the first of the month in the phiale, and at the Epiphany there is a general blessing of water. water-gang† (wâ'tèr-gang), n. A trench or course for conveying a stream of water; a mill-race. Jamicson. [Obsolete or Scotch.] water-gap (wâ'tèr-gap), n. See gap, 2. water-gas (wâ'tèr-gas), n. A gas, non-luminous in its pure form, derived in part from the de-composition of steam.

in its pure form, derived in part from the decomposition of steam. The apparatus for making it consists of a furnace for anthractic coal or other fuel, connected at the top with a tower filled with loose brick and called a regenerator. The products of combustion pass through the regenerator, and raise it to a white heat. Steam is then admitted below the furnace, and, passing upward through the fire and through the regenerator, is decomposed. While the steam is passing the furnace, either coal reduced to dust or crude naphtha is allowed to fall through the ascending steam over the fire. Complicated chemical reactions take place, the result being the formation of quantities of fixed gas. There are also other methods closely allied to this. By one process the non-luminous gas is afterward enriched by the addition of a hydrocarbou, as petroleum or naphtha. Water-gas is commonly thus treated, and used as an filluminating gas; but it is also used, in its non-luminous form, as a heating gas for cooking and other purposes.

Water-gate (wâ'têr-gât), n. [ME. waterqate; (water+gate)] 1. A gateway through which water passes, or a gate by which it may be exeluded or confined; a flood-gate.

But in strata occupying such a position, as well as in the gravel, all wells must be sunk by digging, and not bored, to the natural water-level, there being no superincumbent impermeable stratum to keep down the water at a level below that to which it would naturally have a tendency to rise.

Prestwich, Water-Bearing Strata of London, p. 6.

2. A leveling-instrument in which water is employed instead of mercury or spirit of wine. It consists of a fin tube, about 3 feet long, bent at right angles at each end, with a small short tube soldered on it at its center, by the aid of which it can be fixed upon some kind of a support or tripod. In the bent ends of the long tube are inserted two small glass vials with their bottoms cut off. Enough water is then poured in to about half fill the bottles when the instrument is level. By sighting across the surface of the water a level-line is got. The extreme cheapness and portability of this level make it serviceable sometimes, although it gives but a rough approximation to accuracy as compared with the best kind of spirit-level. A leveling-instrument in which water is of spirit-level.

water-lily (wâ'têr-lil'i), n. [ME. watir-lili, watyr-lyly; water + lily.] 1. A plant of the genus Castalia (Nymphæa), which contains about 25 species distributed nearly throughout genus (*astalia (Nymphæa), which contains about 25 species distributed nearly throughout the world, but most freely in the northern hemisphere and the tropics. They are aquatic plants with a perennial rootstock, orbicular floating leaves, and large flowers, single on long scapes riding on the surface of the water. The flowers have numerous petals of a delicate texture, forming when expanded nearly a hemisphere—white, blue, red, or yellow. Several white water-lilies are the most familiar. The common European species is C. speciosa (N. alba), with leaves 6 or 8 and flowers 3 or 4 inches in diameter. The ordinary American species is C. (N.) odorata, with very sweet-scented flowers often 51 inches wide, and leaves 5 to 9 inches broad, varying in color to pinkish or even bright pink-red, especially at Barnstable, Massachusetts. In the interior United States is found C. (N.) reniformis, with considerably larger leaves and flowers, scentless or slightly apple-scented, and always white—the rootslock bearing numerons self-detaching tubers. The golden water-illy, C. (N.) flava, of Florida, which long escaped the notice of botanists, is a locally abundant species of moderate dimensions, with yellow flowers. C. mystica (N. Lotus), the specific Egyptian water-illy, with white, pink, or red flowers, and C. scutifolia (N. cærulea), the blne water-illy, also of Egypt, are named among the lotuses. C. (N.) thermalis is a rare species occurring in warm springs in Hungary, and called Hungarian lotus. The Australian water-illy, C. (N.) gigantea, has the leaves in the larger specimens 18 inches broad, the flowers a foot broad with over 200 stamens, the petals blue, purple, pink, or rarely white. Of Yesterday and To-morrow take their way!

Longfellow, The Two Rivers, I.

The summit of the pass is called the divide or vactershed. In this last word the "shed" has not the present meaning, but an obsolescent one of "part" or "divide" (Ger. Scheiden). Skeat says: "The old sense 'to part' is nearly obsolete, except in vacter-shed, the ridge which parts river-systems."... The vacter-shed of any river basin limits its "area of catchment," as the hydranile engineers call it.

Macaulay, Hist. Eog., iii.

Every dozen or fifteen miles is a station—two or three sheds, and a water-spout and woodpile.

S. Bowles, Our New West, p. 50.

A spout, jet, or column of water; specifically, a whirlwind over a body of water, producing the appearance of a solid column of cally, a whirly ind over a body of water, producing the appearance of a solid column of water extending from the surface to the clouds. In reality, however, the phenomenon that is seen is the cloud brought down to the earth's surface by the rapid gyratory motion of a vertical whirl, and it consists simply of fine mist surrounding a central axis of rarefaction. At first the cloud has the form of a tapering funnel; then, descending to near the water's surface, it draws up the water or a distance into its vortex, and imparts to it it whirling motion. The spout is then complete, and appears as an immense column connecting sea and cloud, light in color near the center, but dark along the sides. Like other whirlwinds, the waterspout has a progressive as well as a rotary motion, its axis sometimes being inclined forward in the direction of advance. After continuing a short time, generally less than twenty minutes, the column is disunited, the lower part descending as rain, while the apper part is drawn back into the clouds. The height of the spout depends upon the hygrometric state of the air; in general it is between 800 and 2,500 feet. It is common for a number of waterspouts to be seen simultaneously or successively; and this is to be expected, for a series of separate and independent gyrationa are likely to arise when the air is in a state of instability, such as is required for the development of these whirlwinds. This is especially the case in tropical and equatorial regions, where waterspouts are most frequent.

7. One of various Australian and Tasmanian aeacias, valued to some extent for their wood and for their gunt, but more for their bark, which is rich in tannin. For tanbark the most important species are Acacia decurrens, or (if it is distinct from this, as appears to be the case) A. mollissima, the common black wattle, also called green or feathered wattle, and A. psenantha, the broad-leafed or golden wattle. The silver wattle, A. dealbata, closely allied to the black wattle, is distinguished by the ashen color of its young follage, and is a taller tree of moister ground. Its bark is inferior, but is considerably used for lighter leathers. Other species yielding tan-bark are A. saligna (A. leiophyllu), the blackwood or lightwood, A. Melanoxylon, the native hickory (A. subporosa), A. penniervis, etc. Several wattles yield a gum resembling gum arabic, somewhat exported for use in cotton-printing as an adhesive, etc. The principal sources of this product are the black wattle, the broad-leafed wattle, and A. homolophylla.

The form wawe could not, however, change into wave: see waw!. The noun wave, as well as the verb, has been confused with waive!.] 1. A disturbance of the surface of a body in the form of a ridge and trough, propagated by forces tending to restore the surface to its figure of a wilder the surface to its figure of equilibrium, the particles not advancing with the wave.

3. A form assumed by parts of a body which are out of equilibrium, such that as fast as the partieles return they are replaced by others moving into neighboring positions of stress, so that the whole disturbance is continually propagated iuto new parts of the body while preserving more or less perfectly the same propagated into new parts of the body while preserving more or less perfectly the same shape and other characters. In a somewhat wider sense the word is applied in cases where there is no progression through the body; thus, the shape of a vibrating plano-string may be called a wave. But in its narrowest and most proper sense it is restricted to an sd-vaucing elevation or depression of the surface of a body. An advancing elevation is called a positive wave, a depression a negative wave. Waves on the surfaces of liquids are distinguished into four orders. A wave of the first order, also called a vare of translation, leaves the particles, after its passage, shifted in the line of its motion. It is also called a solitary wave, because a single impulse produces but one clevation or depression, which has no definite length, but extends over the whole surface. The negative wave of this sort shortly breaks; it is only the positive wave, which leaves the particles in advance of their initial positions, which can be propagated far. This wave is also called Scott Russell's great wave, hecause it was first discovered by that engineer in 1834, and because, owing to its form, it cannot be seen unless it is very high. The velocity of such a wave is equal to $\sqrt{g(h+k)}$, where g is the acceleration of gravity, h the depth of the liquid in repose, and k the height of the crest of the wave above the plane of repose. This wave dies down of itself in a canal of uniform depth, independently of friction, and when it passes into shallow water it breaks as soon as h is no greater than k. A canal-boat produces such a wave, and consequently can be propelled at the rate of speed of the wave far more economically than at any other. In waves of the second order, called oscillatory avares, observation shows that each particle describes at a uniform rate of motion a circle in a vertical plane; but according to theory other orbits are possible. The particle at the crest of the wave is at the highest part of its path, that in the trough it th

Fig. 1. Standing waves in a torrent.

If the motion of the liquid is irrotational, theory shows that the waves cannot be cycloidal. But in regard to this whole subject actilier theory nor observation can be trusted implicitly to give the truth of nature. The velocity of propagation of oscillatory waves, at least in deep water, is represented by the expression $V(gh/2\pi)$, where h is the length of the wave from crest to crest. But the velocity of propagation of a group of waves is much slower, oscillatory waves break on a shelving shore when their height is about equal to the depth of the water, and from each one, as it breaks, a wave of the first order is produced. (See fig. 2.) Waves of the third order, called ripples, are distinguished from those of the second order in the fact that the shorter they are the more rapidly they move.

While an oscillatory wave 32 inches long will advance 3 feet per second, and one of 3 inches long only 1 foot per second, a ripple a quarter of an inch long will move 1 foot per second, a ripple an eighth of an inch long will

move 1½ feet per second, and so on. The reason is that the force of restoration of the particles is here not chiefly gravity, but the surface-tension of the liquid. Ripples very rapidly die out. Waves of the fourth order are soundthe force of restoration of the particles is here not chiefly gravity, but the surface-tension of the liquid. Ripples very rapidly die out. Waves of the fourth order are sound-waves. They are propagated in water at the rate of about 1,580 yards per second—that is, at a much greater speed than that of sound in air. In the case of sound propagated than that of sound in air. In the case of sound propagated than that of sound in air. In the case of sound propagated than that of sound in air. In the case of sound propagated in the air, the waves are formed by the alternate forward and back motion of the air-particles in the direction in which the sound is being propagated; the waves are consequently waves of condensation and rarefaction, having in the free air a spherical form. The amplitude of vibration or excursion of each particle is very small, but the wave-length is large—for the middle C of the keyboard, about 4½ fect. A sound-wave travels in air about 1,100 feet per second. (See further under sounds.) In the case of radiant energy (heat and light) propagated through the ether, the ether-particles vibrate transversely to the line of propagation; here the wave-length is very small—for violet light, about 0.000,016 of an inch, for red about 185,000 miles per second. Hertz has shown recently (1857) that by a very rapid oscillating electrical discharge, as between two knobs, a disturbance is produced in the aurounding ether which is propagated as electric waves with a velocity like that of light. These electric waves in Hertz's experiments were found to have a wave-length of upward of one meter. They are reflected from the surface of a conductor, but are transmitted by a non-conductor, as pitch, and may be brought to a focus; they may be made to interfere, then forming nodal points, and by pasagag through a grating of parallel wires they may be polarized. These electric waves are hence in all essential respects like light-waves, but differ in their relatively enormous length and the corresponding alowness of the o

Figuratively, a flood, influx, or rush of anything, marked by unusual volume, extent, uprising, etc., and thus contrasted with preceding and following periods of the opposite character; something that swells like a sea-wave at recurring intervals; often, a period of intensity, activity, or important results: as, a ware of religious enthusiasm; wares of prosperity.

A light wind blew from the gates of the ann, And waves of shadow went over the wheat.

Tennyson, The Poet's Song.

An emotional wave once roused tends to continue for a certain length of time. A. Bain, Emotions and Will, p. 32. Specifically—6. In meteor., a progressive oscillation of atmospheric pressure or temperature, or an advancing movement of large extent in which these are considerably above or below the normal: as, an air-wave, barometric wave, celd wave, warm wave, etc. The term barometric wave is often restricted to those changes lo atmospheric pressure which are not connected with cyclonic disturbances nor with the regular diurnal variation, but which include progressive oscillations of a varied character and orlicin, ranging from those of a short wave-length, which occupy but a fraction of a minute in their passage, to those which cover thousands of miles and occupy several days in their development and subsidence. The remarkable air-waves generated by the cruption of Krakatoa are shown by barographic traces to have had an initial velocity of 700 miles an hour, and to have traveled round the earth not less than seven times.

It is preceded by an area of low pressure, and is, in the United States, directly associated with the north-westerly winds which follow a cyclonic depression and accompany the advance of an area of high barometer. The cold wave is, in the United States, in most cases an outpour of cold dry air from the barren plains of British America, where the air is cooled during the long nights of winter to a very low temperature. In Texas and the Gulf of Mexico the cold wave is termed a norther. The approach of cold waves is made a subject of forecast by the United States Weather Bureau. (See under signal.) A decided fall of temperature of less extent, such as frequently occurs in other than winter months, is termed a cool wave. [U. S.] A book-name of certain geometrid moths.

(a) A sea-wave raised at the center of a cyclonic storm by the low atmospheric pressure and the force of the whids. It advances with the progressive motion of the storm, and has all the properties of a true wave. When augmented by a heavy fall of rain, and blown by strong winds upon a low shore, the storm-wave causes disastrous inundations. The thickly populated low-lands at the head of the Bay of Bengal have been the acene of frequent storm-floods, occasioning enormous losses of life and property. natural state it is of a dull-yellow color, and smells of honey. Its consistency varies with the temperature; it is ordinarily a pliable solid, readily melted. When purified and bleached, it becomes translucent white, is less tenacious, without taste or smell, and of a specific gravity a little less than that of water. It softens at 80° F., becoming extremely plastie, and retaining any form in which it may be molded, like clay or putty, and melts at 158° F. Iu chemical composition, wax consists of variable proportions of three substances, called myprocin, ecrolein, and ecrotic acid. Wax is used for many purposes, both in its natural state and variously prepared. As bleached, and also then variously thited, it is made into wax candles, which give a peculiarly soft light. In pharmacy it enters into the composition of various plasters, ointments, and cerates, as a vehicle for the active ingredients, and to confer upon the preparation a desired consistency. It has varied uses in the plastic arts, especially in the making of anatomical models, artificial flowers and fruits, casts and impressions of various kinds, etc.

wax-insect (waks'in sekt), n. 1. One of vari-

ous coccids or bark-liee which secrete wax; a wax-scale. Nearly all the Coccidæ secrete a kind of wax, but that of but few is abundant enough to be of commercial value. Specifically—(a) The Chinese wax-inacct, Ericerus pela (formerly Coccus sinewis or C. pela), related to the cochineat bug. It furnishes most of the white wax of commerce, specified as Chinese wax and pela. This insect, a native of China, occurs upon plants of the genera Rhus, Liquistrum, Hibiscus, Celastrus, etc. The wax is said to be mainly secreted by the male. It is collected from the plants on which it is deposited, melted and clarified, and made into a very high class of candles used in China. It has been imported in England for the same purpose, but is too expensive for general use. (b) Any member of the genus Ceroplastes. The females secrete much wax, usually deposited on the body in regular plates. C. ceriferus is an Indian wax-scale; C. myricæ (an old Linnean species) is found at the Cape of Good Hope; C. floridensis is a wax-scale of Florida; C. cirripediformis is the barnacle-scale. (c) A scale of the genus Cerococcus, as C. quercus, which secreted arge masses of bright-yellow wax upon the twigs of various oaks, as Quercus undulata, Q. agrifolia, and Q. oblongifolia, in Arizons and California. eus coccids or bark-liee which seerete wax; a dæ, and of one of the genera Phenax, Lystra, and Flata. In the case of the species of Lystra, the wax is secreted in long white strings from the end of the abdomen. This wax is said to be used in the manufacture of candles in the East Indies and China.

—Syn. Wayneard, Wilful, Contravy, Untoward, headstrong, intractable, unruly. The italicized words tend
toward the same meaning by different ways. Wayneard,
by derivation, applies to one who turns away from what
he is desired or expected to be or to do; but, from its seeming derivation, it has come to apply more often to one who
turns toward ways that suit himself, whether or not they
happen to be what others desire. Wilful suggests that the person is full of self-will, which asserts itself against those whose wishes onght to be deferred to or whose commands should be obeyed. Contrary and unforard express the same idea, the one in a positive, the other in a negative form. Contrary is an energetie word, expressing the idea that one takes, or is disposed to take, the course exactly opposite to that which he is expected or desired to take. Contrariness, when ingrained, becomes perverseness: as, a contrary disposition; a contrary fellow. This use of contrary is by many considered colloquial, but has the recommendation of ligurative force. Contrary and unforward view the person as one to be managed; untoward views the person also as the object of mental or moral discipline: this perhaps through its use in Acts ii. 40. An untoward person is not responsive to persuasion, advice, influence, or requests; unforward circumstances are similarly such as do not help us in our plans. All these words imply that the only consistency in the person's conduct is in this self-willed independence of others' wishes or opposition to them, but untoward implies it least. See perserse.

way-warden (wā'wâr"dn), n. A keeper or snrvevor of roads.

Woodculter. Had'st best repent and mend thy ways. Peasant. The way-warden may do that; I wear out no ways; I go across country.

Whitney, Life and Growth of Lang., p. 219.

Whitney, Life and Growth of Lang., p. 219. We is frequently used by individuals, as editors and authors, when alluding to themselves, in order to avoid the appearance of egotism which it is assumed would result from the frequent use of the pronoun I. The plural style is used also by kings and other potentates, and is said to have been first used in his edicts by King John of England; according to others, by Richard I. The French and German sovereigns followed the example about the beginning of the thirteenth century.

Shak., J. C., iv. 3, 276.

Weakness is a negative term, and imports the absence of strength. It is, besides, a relative term, and accordingly imports the absence of such a quantity of strength as makes the share possessed by the person in question less than that of some person he is compared to.

Bentham, Introd. to Morals and Legislation, vi. 8, note. It is one of the prime weaknesses of a democracy to be satisfied with the second-best if it appear to answer the purpose tolerably well, and to be cheaper—as it never is in the long run.

Weald (wēld), n. [{ late ME. weeld, appar. an irreg. form of wild (formerly pron. wild), early mod. E. wilde, wylde, found in same sense, confused by later writers with ME. wald, wold, wæld, AS. weald, a forest: see wold. The proper E. form of AS. weald is wold (parallel with bold, fold, hold, sold, told, etc.). The mod. spelling weald represents the earlier weeld, and has nothing to do with AS. weald, unless it is due to Verstegan, who affected the "restitution" of Verstegan, who affected the "restitution" of old forms.] 1. The name given in England to an oval-shaped area, bounded by a line topographically well marked by an esearpment of the Chalk, which begins at Folkestone Hill, near the Chalk, which begins at Folkestone Hill, near the Straits of Dover, and passes through the counties of Kent, Surrey, Hants, and Sussex, meeting the sea again at Beachy Head. It embraces the southwestern part of Kent, the southern part of Surrey, the north and northeastern half of Sussex, and a small part of the eastern side of Hampshire. These are the limits of the area now known to geologists as the Weald; but, according to the English Geological Survey, it is probable that the area anciently designated by that name was somewhat smaller than this, having been bounded by the secarpment of the Lower Greensand, which is approximately concentrie with that of the Chalk, but inside and distant from five to ten miles from it. This latter escarpment is, however, in places rather ill-defined, so that there the boundary of the sncient Weald was doubtful. The geology of the Weald is extremely interesting, hence the name has become very familiar. The formations covering the Weald proper are known as the Wealden (which see). The Weald was originally partly covered with forests and partly destitute of them.

II. n. In geol., the name of a formation extensively developed in the Weald of England (see Weald), and interesting from its position (see Weald), and interesting from its position and organic remains. Its geologieal age is Lower Cretaeeous. The deposits of the Wealden, which have a total thickness of 1,800 feet, precisely resemble those of a modern delta, and the organic remains include landplants, fresh-water shells, and a few estuarine or msrine forms, as also dinosaurs, plesiosaurs, and pterodactyls. The Wealden is separated into two divisions: the Weald Clay, at the top, about 1,000 feet thick, and the Hastings Sand group beneath, which is subdivided, in descending order, as follows: Tunbridge Wells Sand, 120 to 180 feet thick; Wadhurst Clay, 120 to 180 feet; and Ashdown Sand, 400 to 500 feet. The Wealden is overlain conformably by the Lower Greensand.

wearisome (or fatiguing) to speak and to be spoken to.

Tiresome is more often used where one is acted upon; in

strength it is the same as wearisome. Tedious is stronger
than vearisome, and surgests the need of constant effort
of the will to do or to endure; the weariness may be
physical or mental; as, a tedious task; a tedious headache; tedious garrulity. Tedious suggests commonly that
one is acted upon; irksome suggests that one acts or is
called upon to act, and implies also a peculiar reluctance. In Shak, 2 Hen. VI., it. 1. 56, is an example of
the rarer use of irksome to express a wearied shrinking
from being acted upon: "flow irksome is this music to
my heart!" See fatigue, n., and tire!, v. t.

Common Weasel (Putorius vulgaris).

the family Mustelidæ, related to the stoat or emine, ferret, and poleeat of the same genus, and less intimately to the marten or sable of the genus Mustelu of the same family. The species to which the name is most frequently or especially applied is P. vulyaris, the common weasel of Europe and of most of the cold and temperate parts of the northern hemisphere, distinguished by the comparative length and extreme slenderness of the body, and very small size, being only some 6 or 8 inches long, with a tail of 2 inches in length, or less; the color is reddish-brown above, and white below; the tail is of the same color as the body, and not tipped with black. In northerly regions it turns white in winter, like the ermine. It feeds on rats, mice, moles, shrews, small birds and their eggs, and insects; and, though itself classed as vermin by gamekeepers, it is often serviceable as a destroyer of vermin in ricks, haros, and granaries, its small size and lithe, sinuous body enabling it to penetrate almost everywhere. Its cunning and wariness are proverbial in the expression to catch a weaset asteep—that is, to do an extremely difficult thing by strategy, finesse, or unexpected action. Other species of Putorius, properly called veasets, inhabit most parts of the world, and the name has loosely attached to various animals of different families, some of which applications are noted in phrases below. ermine, ferret, and polecat of the same genus,

3t. A light rain; a shower. Wyelif, Deut. xxxii. 2.—4. The state of the air or atmosphere with respect to its cloudiness, humidity, motions, pressure, temperature, electrical condition, or any other meteorological phenomena; the atmospheric conditions prevailing at any moment over any region of the earth: as, warm or cold weather; wet or dry weather; calm or stormy weather; fair or foul weather; cloudy or hazy weather. The investigation of the various causes which determine the state of the atmosphere and produce the changes which are incessantly taking place in its condition forms the subject of meteorology. The average condition of the weather for a considerable period constitutes climate, and the statistical compilation of meteorological observations forms the basis of climatology.

Hakluyt's Voyages, 111. 515.

2. In geol., etc., the action of the elements in changing the color, texture, or composition of rock, in rounding off its edges, or gradually disintegrating it. The first effect of the weathering of rock-surfaces is discoloration. This arises in part from dust or dirt finding its way into the fissures, and is most quickly seen in large cities where much coal is burned. Discoloration often arises from the oxidation of some sulphur compound which the rock contains, and especially of iron pyrites, which is a widely disseminated mineral. Another very perceptible effect of weathering is the loss of the luster which many rock-constituents naturally have. This is particularly conspicuous in the case of feld-spar, and is the result of incipient decomposition and hydration. Rounding of the edges of angular projectiona of the rock, or of its constituents, is another result of weathering, the decomposed minerals being more easily removed by the action of water than they were before decomposition. Weathering is a preliminary to erosion, but the rapidity with which these operations are carried on varies greatly with the nature of the rock and the climatic and other conditions to which it is subjected.

M. Scott, Tom Cringle's Log, viii.

weather-map (werh'er-map). n. A map showing the temperature, pressure, wind, weather, and other meteorological elements over an extensive region, compiled from simultaneous obtensive region, compiled from simultaneous observations at a large number of stations. The pressure is represented by isobars, the temperature by isotherms, the wind by arrows, and the weather by differently shaded circles or other conventional symbols. Weather-maps, prepared once or twice daily, form the basis upon which every government weather-service forecasts the weather and issues storm-warnings.

weather-molding (weth'er-mol ding), n. Same

as dripstone, 1.

weathermost (weth'er-most), a. superl.

weather + -most.] Furthest to windward.

weather-notation (weth'er-no-ta-shon), n. weather-notation (werff er-no-ta'snon), n. A system of abbreviation for the principal meteorological phenomena. Beaufort's weather-notation, which is used in Great Britain, is as follows: b, blue sky, whether clear or hazy; c, clouds (detached); d, drizzling rain; f, fog; g, very gloomy; h, haii; l, lightning; m, mist; o, overcast; p, passing, temporary showers; q, squally; r, rain; s, snow; t, thunder; u, ugly, threatening weather; w, dew.

weather-plant (wefн'er-plant), n. The Indian lieorice, Abrus precatorius: so named in view of an alleged property of indicating the weather in an alteged property of indicating the weather in advance. It is a common tropical twining shrub (see Abrue), having pinnate leaves with from 20 to 40 small leadets. Recent careful observations show that the pairs of leadets fold together more or less as the light is stronger or weaker, the movement being less vigorous in a moister atmosphere; that a certain wrinkling of the surface co-exists with a coloring of the margin likely to be due to the attacks of an insect; and that the movement of the rachis, supposed to be barometric, is a dinrnal oscillation which varies in extent with the amount of light. The temperature also affects the freedom of those motions. These characteristics are all paralleled in other planta, especially of the Legaminosæ. As a means of forecasting, the plant is not likely to be of practical worth.

Weather-proof (weath'er-prof), u. Proof against

weather-proof (wefli'er-prof), a. Proof against rough weather.

Lord, thou hast given me a cell
Wherein to dwell,
A little house, whose humble roof
Is weather-proof.
Herrick, A Thanksgiving to God for his House.

There were only ten persons at the conference meeting last night, and seven of them were women; he woulders how many weather proof Christians there are in the psrish.

C. D. Warner, Backlog Studies, p. 72.

weather-prophet (werH'ér-proflet), n. [= Dan. reir-profet; as weather + prophet.] 1. One who foretells weather; one skilled in foreseeing the changes or state of the weather. [Colloq.]

Who that has read Greek does not know the humour with which the meteorological theories of the Athenian weather-prophets are ridicaled by Aristophanes in "The Clouds"? R. H. Scott, in Modern Meteorology, p. 166.

2. Anything in nature which serves as an in-2. Anything in nature which serves as an indicator of weather changes, as a bird whose regular periodicity of migration or suddenness of appearance may indicate meteorological changes inappreciable by man.

Swallows have long been held for weather-prophets, and with reason enough in the quick response of their organi-zation to the influence of atmospheric changes. Coues, Birds of the Colorado Valley (1878), I. 372.

A device for foretelling changes in the weather. In most forms materials are employed which are so affected by dampness as to move some indicator, as a pair of figures, of which one appears or advances in dry and the other in wet weather. Other forms employ materials which change color according to the state of the atmosphere. Compare weather box.

weather-report (werth 'er-re-port"), n. A daily

report of meteorological observations and of probable changes in the weather, especially one issued by a weather-service. [Colloq.] weather-roll (weth'er-rol), n. The roll of a

ship to windward, in a heavy sea on the beam: opposed to lee lurch.

weather-service (weth'er-ser vis), n. stitution organized for taking meteorological observations in accordance with a systematic plan, and for utilizing the data thus collected by forecasting the weather, issuing warnings of storms and floods, publishing elimatological tables, distributing information as to the effect of the weather on growing crops, and by allied services. All the principal governments of the world now maintain a weather-service, upon which a part or all of these duties are imposed. In the United States an aunual appropriation of uearly a million dollars is made to the Weather Bureau of the Department of Agriculture, which is charged with performing these services. In addition to the Weather Bureau, and cooperating with it, there is organized in nearly every State a State weather-service, composed of voluntary observers whose work is directed toward giving information upon the condition of the crops as affected by the weather, and in general toward extending knowledge of local climatology.

weather-shore (weth'ér-shōr), n. The shore from which the wind blows. of the weather on growing erops, and by allied

[The wind] set so violently as rais'd on the sudden so greate a sea that we could not recover the weather-shore for many houres.

See weaver-bird (we'ver-berd), n. One of numerous Old World (chiefly African and Indian) conirostral passerine birds, noted for the dexterity and ingenuity with which they weave the materials of their nests into a textile fabric, and also for the extraordinary size and unusual shape of some of these structures. The

ric, and also for the extraordinary size and unusual shape of some of these structures. The name weaver-bird, in its present broad sense, is modern, and appears to have originally specified a single species (see below). In the last and early in the present century the birds of this group which were then known were classed with the fluches and grosbeaks, sometimes with the orioles, mainly according to the thickness of the bill, and some of them received still more misleading names. Though there was no trained still 1817, and the family Ploceide not till 1847. With the recognition of this large and varied group, as well marked from the Fringillidæ by the possession of 10 instead of 9 primaries, an English name became a desideratum; and weavers, weaver-birds, or weaver-finches became synonymous with Ploceidæ, without implying that all the birds so named huild very elaborate nests. (See Ploceate, Ploceidæ,) Two remarkable types of nest may be noted. One is the hive-nest of the republican or sociable weavers, many pairs of which build in common an enormous domed structure. (See Philetærus, and cut under hire-nest.) The other, the usual type of nest, is pensile or pendulous, and very closely woven, like that of the American bang-nests, but more elaborate, and with a hole in one side instead of being open at the top, in this respect resembling the nests of various titmice (bush-tits usual shape of some of these structures.

weaveress

and bottle-tits) and some wrens. These nests are generally slung at the ends of long, slender, drooping branches, aften over the water of a pool or stream, where they are safest from monkeys and snakes. In some cases the males build additional nests for themselves, in which no eggs are to be laid—a habit, however, not confined to weaver-birds (see eock-nest). One of the largest, most characteristic, and best-known genera of weaver-birds is that African form called Oryz (a preoccupied name) by Lesson in 1831, and Pyronelana by Bonaparte in that year, though oftener called Euplectes (Swainson, 1837). There are 12 or 15 species, the characteristic coloration of which is black set off with scarlet or orange in large massed areas. P. oryz, the male of which is scarlet and black, is about 5 inches long; it was originally described by Edwards in 1751 as "the greuadier," from some fancied likeness of its plumage to a soldier's uniform. It inhabits South Africa. P. aurea of western Africa is the golden-backed finch and gold-backed grosbeak of the early ornithologists, being one of the yellow and black species. P. eapensis, the Cape grosbeak of Latham, is another, from Cape Colony. P. taha, sometimes known as the Mahali weaver, and generally called Ploceus or Euplectes taha, is very small (scarcely 4½ inches long), of rich goldenyellow and velvety-black hues, and its nest is disproportionately large. It belongs to an extensive region of south-castern Africa. (See cut under taha.) Several other African weavers represent the genus Ploceipasser, as P. mahali. There is a large series of small birds, all technically weavers (Ploceidæ), which fall in the spermestine division of the family, and belong to numerous genera of the Ethioplan, Orlental, and even the Australian region, as various annadavats, waxbills, strawberry-finches, blood-finches, senegals, etc. (See Viduinæ (a), and cuts under Ploceus, Senegal, Teniopygia, and waxbill.) called yellow-crowned weaver and Ploceus icterocephalus. This is 7 Inches long, of an olive and golden-yellow and black color; it builds a large bottle-shaped or kidney-formed pensile nest. Foudia is a Madagascar type. The most extensive genus of all is the African Hyphentornis, with over 30 species, or the golden weavers, as H. galbula. These birds represent in Africa, or may be compared with, the hang-nest orioles of America. One of the longest- and best-known is H. cucullatus of western Af-

Weaver-bird (Hyphantornis textor).

rica, from Senegambia to the Gaboon; it has oftener been called H. textor (after Oriolus textor of Gmella, 1788), and enjoys the distinction of being one of the first, if not the first, to which the name neaver attached, being the never-oriole of Latham (1782); it is 6 inches long, yellow and black. Malimbus is an African genus of black and crimson, scarlet, vermilion, or yellow coloration, as M. cristatus. The African genus Textor (one of the early names—Temminck, 1828) has 2 marked species, T. albirostris (or nelecto), the white billed, and T. ernthrorhynchus (or niger), the red-billed. (See cut under Textor.) Finally, the genus Ploceus itself as now restricted is an Oriental type of a few species, commonly called baya-birds, though it used to be indiscriminately applied to any of the foregoing, and became the name-giving genus of the whole group. See cut under Ploceus. (For those Ploceidæ known as whidah-birds, see Viduins.)

fabries by means of a loom from the combination of thereals are filewents. fabries by means of a loom from the combination of threads or filaments. In weaving all kinds of fabrics, whether plain or figured, one system of freads, called the woof or weft, is made to pass alternately under and over another system of threads, called the varp, web, or chair. The essential operations are the successive raising of certain threads of the warp and the depression of others, so as to form a sked for the passage of the weft-yarn, which is then beaten up by means of n lathe or batten. Weaving is performed by the hand in what are called hand-looms, or by steam-power in what are called power-looms, but the general arrangements for both are to a certain extent the same. (See boun!) Weaving, in the most general sense of the term, comprehends not only the mannfacture of those textile fabrics which are prepared in the loom, but also that of network, lacework, etc. See cut under shuttle.

week¹ (wēk), n. [Early mod. E. also weke; <
ME. weke, wike, wuke, woke, wouke (pl. wiken, woken, wikes, wukes, wokes), a week, period of seven days, < AS. wice, wicu, wuce, wucu = OS. wika = OFries. wike = MD. weke, D. week = MLG. weke, LG. weke, week, week = OHG. wehla, also wohha (> Finnish wiika), MHG. woche, wuche, G. woche, week, = Icel. vika = Sw. veeka = Dan. uge (for *vuge), a week, = Goth. wikō, found in the phrase wikōn kunjis scinis, tr. Gr. ἐν τῆ τάξει ἐσυμερίας αὐτοῦ. L. in ordine vicis sure. τη τάξει έφημερίας αυτού, L. in ordine vicis suæ, 'in the order of his course,' Lnke i. 8, but prob. to be taken, in the Goth., as 'in the week or period of his course, wikon appearing to mean 'succession,' 'change,' hence 'recurrent period,' and to be allied to Icel. $r\bar{i}kja$, turn, retnrn, etc.: see weak. The collocation of the Goth. $wik\bar{o}n$ and the L. vicis in this passage, and the resemblance of form, have given rise to the notion that the Teut. word is borrowed from the L.; but the L. word equiv. to wikon is ordine, and there is no evidence that L. "viz, vicis was ever used in the sense 'week.'] 1. A period of seven days, of which the days are numbered or named in like succession in every period—in English, Sunday (or first day, etc.), Monday, Tuesday, Wednesday, Thursday, Friday, Saturday (or seventh day); hence, a period of seven days. The week is not dependent upon any other period, as a subdivision of that period, but cuts across the division-lines of month and year alike with its never-ending repetition. In general Jewish and Christian belief, it is founded on the creation of the world in six days (according to the account in Genesia), with a succeeding seventh day of rest, specially commenorated by the Jewish rest-day, or Sabbath, our Saturday. It has also been conjectured to represent a fourth of the lunar month of about 28 days; but no people is known as having made and maintained such a subdivision of the month. As a period and division of time, its use is limited to Jews and Christians (including also in some measure the Mohammedans, by derivation from these); but the week-day names and their succession are found more widely, and are of a wholly different origin; they rest upon an astrological principle, which assignae each day in succession to one of the planets as regent; and they further involve a division of the day into 24 hours. If the planets are arranged in the order of their distance from us as held by the ancients—namely, Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon,—then, if the first hour of a day is allotted to Saturn, and each following hour to the next planet, the 25th hour, or the first of the next day, will fall to the Sun, the 49th, or the first of the next day, will fall to the Sun, the 49th, or the first of the first hour of a day is allotted to Saturn, and each following hour to the next planet, the 25th hour, or the first of the first hour of a day is allotted to Saturn, and each following hour to the next day of whose first hour it is regent, the days are Sun's day, Moon'a day, Mars' day, a there is no evidence that L. *vix, vicis was ever used in the sense 'week.'] 1. weever2 (we'ver), n. [Formerly spelled weaver, and appar. a particular use of weaver. Zoologists now connect it with the L. specific name vipera, as if weever were a var. of the obs. wirer.] Either one of two British fishes of the genus Truchinus, the greater, T. draco, 10 or 12 inches long, and the lesser, T. vipera, of half this Lorett, hence any member of the Truchinus. this length; hence, any member of the Tra-

inches long, and the lesser, T. vipera, of half this length; hence, any member of the Trachinidæ (which see). These fishes have sharp dorsal and opercular spines, with which they may inflet a painful and serious wound when incautionsly handled. It does not appear that the spines convey a specific poison, but they are smeared with a sline which causes the puncture they inflict to fester, like the similar wound from the tail-spine of the sting-ray. See cut under Trachinus.

weever-fish (wē'v'er-fish), n. Same as weever?.

weevil (wē'v'l), u. [Early mod. MHG. wibel, G. wiebel, wibel, a weevil, = Ieel, yfill (in comp. tord-yfill, dung-beetle).] 1. A snout-beetle; any coleopterous insect of the section Rhyuchophora (which see). The term is more properly restricted to the long-snouted forms of the tamily Carcalionidæ, but is also extended (beyond the Rhynchephera) to the family Bruchidæ. The weevils are almost exclusively plant-teeders; most of them live in units, grains, the stems of plants, rolled-up leaves, catkins, or fruit, while others are leaf-miners, and a few live in gall-like excrescences on thestensor roots of plants. Brachylaraus contains the only carnivorous forms, and those are said to live on bark-lice. Some forms are sub-aquatic, as the water-weevil, Esserboyters simplex. [\langle ME. weft, \langle AS. weft, weft (weft), v. [\langle ME. weft, v], threads weren into and crossing the warp; with formative -t, \(\sigma vertext{wefan}, \text{weave}: \see weave^1. \] 1. The threads, taken together, which run across the web from side to side, or from selvage to selvage. Also called woof.

The west was so called from its being "wasted" in and out of the warp; it is also often called the woof, though more correctly the woof is the same as the web or finished stuff.

Encyc. Brit., XXIII. 206.

2. In bot., a name sometimes given to a feltlike stratum produced in certain fungi by abundant closely interwoven hyphæ.

The peripheral portion of the delicate hyphal weft.

De Bary, Fnngi (trans.), p. 217.

weft2+. An obsolete form of the preterit and past participle of wave1.

Ne can thy irrevocable desteny bee wefte. Spenser, F. Q., III. iv. 36.

weft³t, n. Same as waif. weft⁴ (weft), n. A dialectal form of waft, 3.

The strongest sort of smells are best in a weft afar off.
Bacon, Nat. Hist., § 833.

weftaget (wef'tāj), n. [$\langle weft1 + -age.$] Texture; the style or quality of the web, as of any weftaget (wef'tāj), n. textile fabric.

The whole muscles, as they lie upon the bones, might be truly tanned, whereby the weftage of the fibres might more easily be observed. Grew, Museum. (Latham.)

weft-fork (weft'fôrk), n. 1. A device employed in some looms to lay in, piece by piece, a filling of slats, whalebone, palm-leaf, or other stiffening material.—2. An early arrangement for stopping a loom in case of the failure of the weft-thread. It is essentially a weighted lever, which is supported by the west-thread, and personns its action by falling in the event of the breakage or failure of the

thread.

weft-hook (weft'hnk), n. A tool used to draw
the filling through the warp in some kinds of
hand-weaving, as in slat-weaving and some
narrow-ware weaving or ribbon-weaving.

wegget, n. A Middle English form of wedge¹.

weght, weigh³t, n. See wie.

weght, n. See weeht.

weghtnest, n. Same as wightness. weheet, n. See wighte.

wehrele, n. See wighte.
wehrgeld, wehrgelt, n. See wergild.
wehrlite (war'lit), n. [Named after Aloys Wehrle, an Anstrian metallurgist and mining official (1791-1835).] A mineral obtained from Deutsch-Pilsen, in Hungary, in steel-gray folia with bright metallic luster and high specific with bright metallic inster and high specific gravity (8.4). It consists essentially of bismuth and tellurium, and some snalyses show the presence of a small amount of silver. It is allied to tetradymite, but its exact composition is uncertain, and it is possible that more than one species may be included under the name. Wehr-wolft, n. See werwolf.

Weit, n. An old spelling of way.

Weibyeite, n. A rare fluo-carbonate of the metals of the cerium group, occurring in minute white crystels in southern Narway.

white crystals in southern Norway.

white crystals in southern Norway.

weid (wēd), n. Same as $xeed^3$.

weiet, r. An old spelling of $xeigh^1$.

Weierstrassian (vī-ėr-stras'i-an), a. Of or pertaining to, or named from, K. T. W. Weierstrass, a German mathematician (born 1816).

—Weierstrassian function. (a) One of the functions used in Weierstrass's method of treating elliptic functions.

(b) The function

(b) The function $fx = \sum_{0}^{\infty} b^{n} \cos t(a^{n}) x\pi.$

In certain cases, as when $p=1, b < 1, ab > 1+\frac{n}{2}\pi$, this function, although continuous, has no differential coefficient. In fact, the curve of the function, when seen at a distance, appears like a simple curve of sines; but when it is magnified, small waves are seen upon it; under a higher magnifying power, wavelets on these waves; and so on ad infinitum; so that, although f(x+h) - fx becomes infinitesimal with h, yet it has no limiting ratio to h.

Weierstrass's fundamental theorem.

Weigert's method. The method of tracing the course of the medullated nerve-fibers by hard-

course of the meduliated nerve-noers by hardening and staining them.

To raise or lift; bear np: as, to weigh anchor; to weigh a ship that has been sunk.

And so ye same mornyng we wayde our sncre and made sayle, and come into the foresayd havyn at Mylo.

Sir R. Guylforde, Pylgrymage, p. 63.

[The shlp] struck upon a rock, and, being forced to run ashore to save her men, could never be veighed since, although she lies a great height above the water.

li'inthrop, Hist. New England, I. 3.

2. To bear up or balance in order to determine the weight of; determine the relative heaviness of (something) by comparison in a balance with some recognized standard; ascertain the number of pounds, ounces, etc., in: as, to weigh sngar; to weigh gold.

Like stuffe hane I read in S. Francis Legend, of the ballance wherein mens deedes are weighed, and the Deuill lost his prey by the weight of a Chalice.

Purchas, Pilgrimage, p. 140.

The hunter took up his rifle instinctively from the corner of the room, weighed it in both hands held palm upward.

W. M. Baker, New Timothy, p. 297.

3. To consider or examine for the purpose of forming an opinion or coming to a conclusion; compare; estimate deliberately and maturely; balance; ponder: as, to weigh the advantages and disadvantages of a scheme.

In noble corage oghte been areste, And weyen every thing by equitee. Chaucer, Good Women, 1. 398.

Wherefore I pray you weigh this with yourself the better, and see whether you can eapy how your doctrine is doubtful. J. Bradford, Letters (Parker Soc., 1853), II. 130.

Regard not who it is which speaketh, but weigh only hat is spoken.

Hooker, Eccles. Polity, Pref., i. what is spoken. Weigh oath with oath, and you will nothing weigh.
Shak., M. N. D., iii. 2. 131.

41. To consider as worthy of notice; make account of; care for; regard; esteem.

You weigh me not? 0, that's you care not for me, Shak., L. L. L., v. 2. 27.

You are light, gentlemen, Nothing to *weigh* your hearts. Fletcher and Shirley, Night-Walker, i. 1.

5. To overweigh or overpower; burden; oppress. See the following phrase.—To weigh down. (at) To preponderate over.

We weight King Richard down.

Shak., Rich. H., iii. 4, 89. (b) To oppress with weight or heaviness; overburden; depress.

Thon [sleep] no more wilt weigh my eyelids down. Shak., 2 Hen. IV., iii. 1. 7.

II. intrans. 1. To weigh anchor; get under way or in readiness to sail.

When he was aboard his bark, he weighed and set sail, and shot off all his guns.

Winthrop, Hist. New England, II. 232.

The vessel weighs, forsakes the shore, And lessens to the sight. Cowper, The Bird's Nest.

2. To have weight, literally or figuratively.

Alliances, how near soever, weigh but light in the Scales of State.

Baker, Chronicles, p. 117.

3. To be or amount in heaviness or weight; be of equal effect with in the balance: as, a nugget weighing several ounces; a load which nugget weight geveral ounces; a foat which are in the adverbial objective. That which a balance measures is the proportionate acceleration of masses toward the center of the earth. This is equal to their proportionate masses; and mass is the important quantity determined. The weight, or attraction of gravitation (less the centrifugal force), differs at different stations, and is not determined by the operation of weighing.

And the Frensshe kyng gaue hym a goblet of syluer weynge liii. marke.

Berners, tr. of Frolssart's Chron., 11. lxxxvii.

Master Featherstone, O Master Featherstone, you may now make your fortunes weigh ten stone of feathers more than ever they did!

Dekker and Webster, Northward Ho, v. I. 4. To be considered as important; have weight

in the intellectual balance. He finds . . . that the same argument which weighs with him has weighed with thousands . . . before him.

Bp. Atterbury, Sermons, 11. li.

Such considerations never weigh with them.

Goldsmith, Citizen of the World, xel.

5. To bear heavily; press hard.

Cleanse the stuff'd bosom of that perilous stuff Which weighs upon the heart. Shak., Macbeth, v. 3. 45.

6. To consider; reflect.

My tongue was never oil'd with "Here, an't like you,"
"There, I besecch yon"; **xeigh, I am a soldier,
And truth I covet only, no fine terms, sir.
**Pletcher, Loyal Subject, ii. 1.

The soldiers, less weighing because less knowing, clamoured to he led on against any danger.

Milton, Hist. Eng., ii. To weigh down, to sink by its own weight or burden.

The softness of the stalk, which maketh the bough, heing over-loaden, . . . weigh down.

Bacon, Nat. Hist., § 610.

To weigh in, in sporting, to ascertain one's weight before the contest. Whyte Metville, White Rose, I. xiv. weigh! (wā), n. [\(\cdot weigh! \), v.] A certain quantity or measure, estimated by weight; a measure of weight (compare wey); in the South Wales coal-fields, a weight of ten tons. weigh² (wā), n. A misspelling of way^1 , in the

phrase under way, due to confusion with the phrase to weigh anchor.

We lost no time in getting under weigh again.

B. Taylor, Lands of the Saracen, p. 230.

weighable (wā'a-bl), a. [< weigh1 + -able.]
Capable of being weighed.
weighage (wā'āj), n. [< weigh1 + -age.] A
rate or toll paid for the weighing of goods.

Imp. Diet.

weigh-bauk (wā'bâk), n. The beam of a balance; hence, in the plural, a pair of seales. [Scotch.]

Capering in the sir in a pair of weigh-bauks, now up, now down. Scott, Redgauntlet, xxiv. (Eneyc. Dict.)

weigh-beam (wā'bēm), n. A weighing-seale earried by a wooden or iron horse, for convenience in weighing freight at a dock or railroadstation; a portable seale used by custom-house weighers, etc.

weigh-board (wa'bord), n. In mining. See way-

weigh-house (wā'hous), n. A building (generally of a public character) at or in which goods are weighed by suitable apparatus.

He shall, with an hour's lying in the pulpit, get enough to find thirty or forty stardy lubbers a month long, of which the weakest shall be as strong in the belly, when he cometh unto the manger, as the mightiest porter in the weigh-house.

Tyndale, Ans. to Sir T. More, etc. (Parker Soc., 1850), p. 76.

weighing (wā'ing), n. [\langle ME. weyynge, weynge; verbal n. of weigh!, v.] 1. The act of ascertaining weight.—2. As much as is weighed at once: as, a weighing of beef. Imp. Diet.—3. Samo as weighting.

weighing-cage (wa'ing-kaj), n. A cage in which living animals, as pigs, sheep, and ealves, may be conveniently weighed.

weighing-house (wā'ing-hous), n. Same as

weigh-house.

weighing-machine (wa'ing-ma-shēn"), n. contrivance by which the weight of an object may be ascertained, as the

common balance, springbalance, steelyard, etc. See cuts under balance See cuts under balance and steelyard. The term is, however, generally applied only to those contrivances which are employed for ascertaining the weight of heavy bodies, as the machines for the purpose of determining the weights of laden vehicles, machines for weighing heavy goods, as large casks, bales, etc. The hydrostatic weighing-machine (see cut) consists essentially of a strong cylinder within which moves a tightly packed jdston, the space being filled with castor-oil; the loop above is attached to the cylinder and the ring below to the piston. When the object to be weighed is hung on the ring, the piston presses on the oil, and this passes by a channel to a gage

which indicates by the motion of the index on the dial the weight in pounds and tons.

Weighing-scoop (wā'ing-sköp), n. A combined scoop and spring-balanee. The spring is in the handle of the scoop, and while the scoop is being filled the spring is held in place by a stop controlled by the thumb. On raising the loaded scoop the stop is released, and the weight of the contents is indicated on the handle. E. H. Knight.

weigh-lock (wā'lok), n. A canal-lock at which barges are weighed and their tonnage is settleď

weighman (wā'man), n.; pl. weighmen (-men). A weigher. [Rare.]

Two weeks after the coopers' strike came the strike of the lightermen and weighmen.

U. S. Cons. Rep., No. lxv. (1886), p. 266.

The reg. mod. form etc., raise, litt: see weigh!. The reg. mod. form would be wight (parallel with night, sight, etc.); the present vowel-form is due to conformity with the verb weigh!.] 1. Downward force of a body; gravity; heaviness; ponderousness; more exactly, the resultant of the force of the earth's gravitation and of the centrifugal pressure from its axis of retation considered as more exactly, the resultant of the force of the earth's gravitation and of the centrifugal pressure from its axis of rotation, considered as a property of the body affected by it. Considerable confusion has existed between weight and mass, the latter being the quantity of matter as measured by the ratio of the momentum of a body to its velocity. Weight, in this the proper sense of the word, is something which varies with the latitude of the station at which the heavy body is, being greater by \(\frac{1}{1} \) for itself at the poles than at the equator; it also varies considerably with the elevation above the sea (\(\frac{1}{1} \) for every kilometer). The weights of different bodies at one and the same station were proved, by Newton's experiments with pendulums of different material, to be in the ratio of their masses, and irrespective of their chemical composition; consequently, a balance which shows the equality of weight of two bodies at one station also shows the equality of their masses. In determining the specific gravity of a body, it is hung by a fine thread to one pan of the balance, and immersed completely in water. The reduced number of pounds, ounces, etc., which is required in the other pan to balance the first, under these circumstances, is called the weight of the body in water. In like manner, we speak of the weight in air and the weight in water. These expressions forbid our conceiving of weight as synonymous with the quantity of matter; and yet, when a pound is said to be a unit of weight, although it is intended to be cerried up mountains and to distant places, mass, or quantity of matter, must be understood, since there is no important quantity but the quantity of matter which a pound or a kilogram measures. The confusion is increased when the pound is defined, as it still is in the United States, by the weight of a certain standard in air, without reference to the height of the barometer and thermometer. In the older books on mechanics, a pound is taken as a force, and the quantity of ma sure from its axis of rotation, considered as a

Of pured gold a thousand pound of wighte.

Chaucer, Franklin's Tale, 1, 832.

So Belglan mounds bear on their shattered sides The sea's whole weight, increased with swelling tides. Addison, The Campaign.

Though a pound or a gramme is the same all over the world, the weight of a pound or a gramme is greater in high latitudes than near the equator.

*Clerk Maxwell, Matter and Motion, Art. xlvii.

Mass; relative quantity of matter. -3. A heavy mass; specifically, something used on account of its weight or its mass. Thus, the use-fulness of the weights that a man holds in his hands in leaping or jumping lies in the addition they impart to his momentum, and their dragging him down is a disad-vantage; but the weights of a clock are for giving a down-ward pull, and their momentum is practically nothing.

A man leapeth better with weights in his hands than ithout. Bacon, Nat. Hist., § 699.

4. Specifically, a body of determinate mass, intended to be used on a balance or scale for measuring the weight or mass of the body in the other pan or part of the scale (as the platform in a platform-scale).—5. A system of units for in a platform-scale).—5. A system of units for expressing the weight or mass of bodies. Avoir-dupois weight is founded on the avoirdupois pound (see pound!), which is equal to 453.5926525 grams. It is divided into 16 ounces, and each ounce into 16 drams; 112 (in the United States commonly 100) pounds make a hundred weights at on. (see ton!). The stone is 14 pounds. Troy neight is founded on the troy pound, which is 373.242 grams. It is divided into 12 ounces, each ounce into 20 pennyweights, and each pennyweight into 24 grains. But formerly the pennyweight was divided into 32 real grains. There was also an ideal subdivision of the grain into 20 mites, each of 24 droites, each of 29 peroits, each of 24 blanks. The goldsmiths also divided the onnee troy into 24 carats of 4 grains each for gold and silver, and into 150 carats of 4 grains each for diamonds. Troy weight, formerly employed for many purposes, is now only used for gold and silver. Apothecaries' weight, still used in the United States for dispensing medicine, divides the troy ounce into 3 drams, each dram into 3 scruples, and each scruple into 20 grains, which are identical with troy grains. For weight in the metric system, see metrics.

to pressure from above, which takes effect as the coal is worked away. In long-wall working, the weight is usually of importance, as causing the coal, after it has been holed, to "get itself"—that is, to break down without the necessity of using powder, wedges, or something similar. Properly, "weight" is the cause and "weighting" the result, but the two words are often used with nearly the same meaning.

It is characterized by flowers with Imbriested sepals, four or five petals, eight or ten long stamens inserted on the base of a free disk, and small oblong, commonly pilose seeds. There are about 60 species, principally of tropical or sonth temperate regions, occurring in America, Australia, New Zealand, and the Mascarene and Pacific islands. They are trees or shrubs with opposite branchets, opposite coriaceous, often glandular leaves, odd-pinnate with a winged rachis. The small white flowers are disposed in simple terminal or axillary erect racenes, followed by small coriaceous two-celled capsules splitting into two sharp boat-like valves. Some species afford a soft light wood used in carpentry and cabinet-work. A Peruvian species yields an astringent bark utilized in tanning. W. tinctoria is employed in the Isle of Bourbon in dyeing red. W. pinnata, a tree with downy branches, native from the West Indies and Mexico to Guiana, is known in Jamsica as bastard braziletto. W. Weir, Wear³ (wēr), n. [The spelling weir is irreg. and appar. Se.; the proper spelling is wear; early mod. E. wear, weare, were, sometimes wire; \(ME. wer \) (dat. were), \(AS. wer, a \) weir, dam, fenee, hedge, inclosure, = G. wehr, a weir, dam, dike, = Icel. vörr, a fenced-in landing like, is the rest of \(S. \) Serigis. ing-place; from the root of AS. werian, protect, guard, defend, etc., also fence, dam: see weur²]

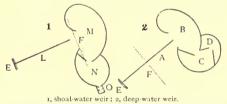

1. A dam erected across a river to stop and raise the water, as for the purpose of taking fish, of conveying a stream to a mill, of maintaining the water at the level required for navigating it, or for purposes of irrigation.

2. A fence, as of twigs or stakes, set in a stream for catching fish. Weirs differ from pounds principally in being constructed, in whole or in part, of brush or of narrow boards, with or without netting; and they are sometimes arranged so that at low tide a sandbar cuts off the escape of the fish, leaving them in a basin, and allowing them to be taken at any time before a certain stage of rise of the next tide. Weirs are of two kinds, the shoal-water weir and the deep-water weir. The shoal-water weir, as illustrated in fig. I, has a leader I, which is a row of stakes, generally woven with brush, leading out from the shore. Its extremity is at the entrance of the big

pound M. The big pound is likewise of stakes filled with brush, and its entrance 30 feet wide. This leads by a passage 5 feet wide into the little pound N, and this into the pocket 0, which is a frame about 16 feet long and 10 feet wide, with sides of netting, and a board floor. The fish following the shore meet the leader, turn and follow it into the big pound; here they follow the side around until they pass into the little pound, and from that into the pocket, where they are left by the receding tide and taken out at low water. The deep-water weir (fig. 2) has a similar leader A, extending to the entrance of the big pound, or heart, B, beyond which are the small pound C and the bowl D, into which the fish finally go. The form of the inclosures in both cases leads the fish constantly forward, and they rarely or never find their way back through the passages. In both figures E represents the land or highwater mark, and F the low-water mark. pound M. The big pound is likewise of stakes filled with

1. To unite or consolidate, as pieces of metal or a metallic powder, by hapmaging or com-

or a metallic powder, by hammering or compression with or without previous softening by heat. Welding is and has long been a matter of great practical importance, chiefly in the manufacture of iron and steel, and of the various tools, utensils, and implements made of those metals. Iron has the valuable property of contlinuing to a kind of pasty condition through quite a wide range of temperature below its melting-point, and this is a circumstance highly favorable to the process of welding. Most metals, however, pass quickly, when sufficiently heated, from a solid to a liquid condition, and with anch welding is more difficult. The term welding is more generally used when the junction of the pieces is effected without the actual fusing-point of the metal having been reached. Sheets of lead have sometimes been united together by fusing the metal with a blowpipe along the two edges in contact with each other, and this has been called autogenous soldering, or burning if the heating was done with a hot iron. Still, "the difference between welding and autogenous soldering is only one of degree "(Percy). The term veelding is also used in speaking of the uniting of articles not metallic. Most metals when in the form of powder can be consolidated or welded into a perfectly homogeneous mass by sufficient pressure, without the aid of heat. The same is true of various non-metallic substances, such as graphite, coal, and probably many others. A method of welding has been recently invented by Elihu Thouson, which appears to be capable of being employed with a variety of metals on a very extensive scale. In this, which is known as electric welding, a current of electricity heats the abutting ends of the two objects which are to be welded, theae being pressed together by mechanical force, and so arranged with reference to the electric current that there is a great and rapid accumulation of heat at the joint, in consequence of the greater relative conductivity of the rest of the circuit. This method of welding in some cases part or a metallic powder, by hammering or com-pression with or without previous softening by

Well¹ (wel), n. [⟨ ME. wel (well-), also welle, wille, wille, ⟨ AS. well, wyll, also wella, wylla, a well, spring (= MD. welle, D. wel = OHG. wella, MHG. G. welle, a wave, billow, surge, = Ieel. vella, boiling, ebullition, = Dan. væld (for *væll), a spring), ⟨ weallan, boil: see wall², and ef. wall², n., and well¹, v.] 1. A natural source of water; a place where water springs up in or issues from the ground: a spring or well-spring: a from the ground; a spring or well-spring; a from the ground; a spring or well-spring; a fountain. As soon as a spring begins to be utilized as a source of water-supply it is more or less thoroughly transformed into a well. (See def. 4.) This is necessary, both for rendering the access to it convenient, and for giving the water a chance to accumulate and be protected when not needed for use. Hence the word spring is much used by geologists in describing the natural sources of water-supply, and well, by those indicating the mammer in which the supply has been made available. There is, however, no sharp distinction possible between the two words. Thus, Prestwlch speaks of the "beautiful spring [between Circucester and Cheltenham] known as the Seven Wells," and Phillips of a "feehle intermittent spring [issuing from Giggleswick Scar, in Yorkshire] known as the Ebbing and Fluwing Well."

Ther were a fewe welles

Hence - 2. The source whence any series or order of things issues or is drawn; a well-spring of origin or supply; a fount in the figurative sense.

He that is of worthinesse the welle. Chaucer, Troilus, ii. 178. Dan Chaucer, well of English undefyled.
Spenser, F. Q., IV. ii. 32.

3. That which flows or springs out or up from a source; water or other fluid issuing forth.

And from his gored wound a well of bloud did gush. Spenser, F. Q., I. iii. 35.

The water that I shall give him shall be in him a well of water springing up into everlasting life. John iv. 14.

4. A pit, hole, or shaft sunk in the ground, either by digging or by boring through earth and rock, to obtain a supply of water, or of other fluid, as mineral water, brine, petroleum, or natural gas, from a subterranean source, and walled or otherwise protected from eaving in.
Wells are generally cylindrical, and are sometimes bored
to a depth of several hundreds or thousands of feet. (See
Artesian well, under Artesian. See also oil-well, tube well.)
From ordinary wells for domestic use the water is raised
in vessels—generally buckets hung in pairs to a windlass

or singly to a well-sweep - or, as from deeper wells, by pumping.

'Tis not so deep as a *well*, nor so wide as a church-door; at 'tis enough.

Quoted in Ashton's Social Life in Reign of Queen Anne,

Syn. 4. Well, Spring, Fountain, Cistern, A well is an artificial pit sunk to such a depth that water comes into the bottom and rises to the water-level, ready to be drawn up. A spring is a place where water comes naturally to the surface of the ground and flows away: a spring may be opened or struck in excavation, but cannot be made. A fountain is characterized by the leaping upward of the water: it may be natural, and thus be a kind of spring, or it may be artificial, as in a public square. A cistern is an artificial receptacle for the storage of water, as that which is conducted from roofs; figuratively, the word may be applied to similar natural subterranean reservoirs.

Welwitschia (wel-wich'i-ā), n. [NL. (J. D. Hooker, 1863), named after Friedrich Welwitsch (1806-72), an Austrian botanist and traveler.] A genus of gymnospermous plants, of the order Gnetaeeæ, among the most remarkable in the vegetable kingdom, distinguished by diœcious many-flowered imbricated conellar spikes reprised a short like spikes panicled at the margin of a short woody trunk. The only species, W. mirabilis, is a native of sandy regions of southwestern tropical Africa, in Benguela and Damara-land, between 14° and 23° south latitude.

Welwitschia mirabilis. i. Entire plant, 2. Branch of the panicle, a, stamen—tube laid open, showing the inclosed wule; b, pollen grants; c, scale of cone will flower-bud; d, seed, longitudinal section, showing the catyptriform integument at its apex; c, ripe seed and base of pericarp; f, pericarp with styliform apex of the integument of the seed; g, embryo.

integument at its apex; if, ripe seed and base of pericarp; if, pericarp with styliform apex of the integument of the seed; if, embryo.

Its thick trunk bears but two leaves. The original cotyledons, which are opposite, green, spreading, and persistent, are composed of a bard fibrous substance, and become often 6 feet long and 2 or 3 wide. They finally split into long shreds, but are still retained, it is said, through over a hundred years of growth. The mature trunk forms a tabular mass only about a foot high, but 5 or 6 feet across; the top is truncate, hard, pitted, and broken by cracks, and resembles a fungus of the genus Polyporus; the base is deeply sunk in the soil, and produces middle-sized roots. The pandled inforescence is composed of rigid erect dichotomously jointed stems from 6 to 12 inches high, with two opposite scales sheathing each joint, and is developed annually from the upper side of the trunk at the base of the cotyledons. The flower-spikes are composed of brilliant scarlet scales overlapping, usually in four rows—the male with spikes 1½ inches long or under, the female larger, fewer, and thicker. Each scale contains a flower, the male a small loose membranous perlanth, the filaments comate into a loosely exserted tube, and six anthers, each opening by three apical and finally confluent pores. The funit is dry, two-winged, compressed, inclosed in a fibrous utricle. The new growth is chiefly horizontal, enlarging the stem both above and below the base of the leaf, which finally projects from a deep marginal cavity.

Wernerian (wer-ne'ri-an), a, and n. [\langle Werner (see def.) + -i-an.] I. a. Partaking of or in conformity with the views of Abraham Gottlob Werner (1750-1817), a German geologist, professor in the mining-school of Freiberg, Saxony, who had much influence on the development of geology at the time when this branch of science began to be seriously studied. He was the principal expounder of the so-called Neptunian theory of the earth's formation, according to which the earth was originally covered by a chaotic ocean which held the ma-

terlals of all the rocks in solution, and from which ocean the various formations were precipitated one after another.

The Wernerian notion of the aqueous precipitation of "Trap" has since that date never held up its head.

G. P. Scrope, Geol, and Extinct Volcanos of Central [France, Pref., p. ix.

II. n. In geol., an advocate of the Wernerian

My two friends agreed with me in the opinion that the error of the Wernerians in undervaluing, or rather despising altogether as of no appreciable value, the influence of volcante forces in the production of the rocks that compose the surface of the globe formed a fatal bar to the progress of sound geological science which it was above all things desirable to remove.

Gr. λνκάνθρωπος,) ML. lyean-thropus, > E. lyeanthrope), < wer, man, + wulf, wolf: see wer¹ and wolf.] In old superstition, a human being turned into a wolf while retaining large were into the company of the second control of the company of the company of the second control of the company of the control o a human being turned into a wolf while retaining human intelligence. This transformation was either voluntarily assumed, through infernal aid, for the gratification of eannibalism or other beastly propensities, or inflicted by means of witeheraft; and it might be made and unmade at its subject's will in the former case, or be either temporary or permanent in the latter. A voluntary werwolf was the most dangerous of all creatures, and trials of men on charge of crimes committed while in this form took place in Europe as late as the seventeenth century. But an involuntary werwolf might retain humane feelings and sympathies, and act beneficently as the protector of persons in distress or otherwise; and many medieval legends are based upon this idea. The former belief in werwolves throughout Europe (not yet entirely extinct in regions where wolves still abound) has given the general name legenthropy to belief in the metamorphosis of men into beasts of any kind (generally the most destructive or obnoxions of the locality), prevalent among nearly all savage and semi-civilized peoples.

Westphal balance. A form of balance used in determining the specific gravity of solutions and also of mineral fragments. In the case of frag-ments a "heavy solution" is first obtained, in which they just float. The balance consists of a bar supported on a fulcrum near the middle, and having one halt of it, from whose extremity hangs a sinker, graduated into ten parts. The sinker is immersed in the liquid under experiment, and then riders are hung at suitable points on the bar until it is brought back into a horizontal position as in-dicated by the fixed scale at the other end. The position and size of the riders give the means of reading off at once the required specific gravity without calculation. Westphal. Firb symmtom.

Westringia (wes-trin'ji-ä), n. [NL. (Sir J. E. Smith, 1798), named after J. P. Westring, a physician of Linköping, Sweden, who died in 1833.] A genns of gamopetaleus plants, of the order Labiatæ and tribe Prostanthereæ. It is characterized by a ealyx with five equal teeth, a corolia with the upper lip flattish, and anther-connectives without an appendage. There are 9 or 11 species, all natives of extractorical Australia. They are shrubs with small entire leaves in whorls of three or four together, and sessile or short-pedicelled twin towers scattered in the axils of the leaves, or rarely crowded in leafy terminal heads. W. resmarninformis, the Victorian rosemary, an evergreen shrub growing about 8 feet high, is sometimes cultivated.

See steam and open, 13.—Wet way, in chenn., the method of qualitative and quantitative analysis and assay in which the substance to be examined is first dissolved in some liquid and then treated with liquid reagents: the opposite of fire-assay, or treatment in the dry way. In the ordinary analysis of minerals, the substance is first finely pulverized and then dissolved in an acid, after which further treatment follows. If insoluble in an acid, it is fused with potassium or sodium carbonate, after which treatment the fused mass is soluble, either wholly or in part, the silica (if the mineral is a silicate) separating out and being removed by filtering, after which the process is continued the same way as when the substance is soluble without the necessity of a preliminary stack by an alkali at a high temperature. Ordinary analyses of minerals are made in the wet way, assays of ores not infrequently in the dry way.—With a wet fingert, with little effort or trouble; very easily or readily: probably from the practice of wetting the tinger to facilitate matters, as in turning over a leaf of a book, or rubbing out writing on a slate.

(a) Whale is not less strictly applicable than universally applied to the toothless or whalebone whales, all of which are of great size, and some of which are by far the largest of snimals. They consist of the right whales, finner-whales, and humpbacks, composing the family Balænidæ alone, and represent five well-marked genera, namely: (1) Balæna proper, the right whales, without any dorsal fin and with smooth throat; (2) Neobalæna, based on N. marginata, a whale-bone whale said to combine a smooth throat with presence of a dorsal fin; (3) Rachianectes, with one species, R. glaucus, the gray whale; (4) Megaptera, the thumpbacked whales, with a dorsal fin, furrowed throat, and long flippers, of several nominal species of all seas; and (5) Balænoptera, the true finners, or rorquals, with dorsal fin, furrowed throat, and short flippers: it comprises at least four, and probably more, species. Various other genera lave been named (as Agaphelus for certain so-called scragwhales), and the generic synonyms of these whales are probably more numerous than the actual species. (b) named dolphins, porpoises, etc.: in popular use

whale

in immense areas, to which the whales resort as feeding-grounds. Some whales attack large animals, even of their own kind (see killer, Orcal), but nearly sill are timid and inoffensive, seeking only to avoid their enemies, though capable of formidable resistance to attack. Whales bring forth their young alive, like all mammals above the monotremes, and suckle them; the teats are a pair, beside the vulva. They breathe only air, for which purpose they must regularly seek the surface, though capable of remaining long under water without respiring. The sponting of the whale is the act of expiration, during which the air in the lungs, loaded with watery vapor, is forefolly expelled like apray in a single stream, or in two streams, according as the blowholes are single or there are a pair of these apiraclea. Some sea-water may be mixed with the breath, if the whale aponts beneath the surface, but the visible stream is chiefly condensed vapor, like that of human breath on a cold day. Whales have a naked skin, saving a few bristlea about the mouth, chiefly in the young; the bide is often incrusted with barnacles, or infested with other crustacean parasites. The bodily temperature is maintained in the coldest surroundings by the heavy layer of blubber which lies under the skin of the whole body, and in the sperm-whale forms a special deposit on the skull, giving its singular shape to the head. The general form of the body is like that of a fish, in adaptation to entirely aquatic habits and means of locomotion. It tapers behind the body-eavity in a solid muscular part, the small, and ends in broad, short filtucely lips portzontally and extending from side to side. This tail-fin is the principal organ of locomotion, like the vertical caudal fin of a fish. The fore limbs form flippers of varying length in different species. These fina are of medium length in the right whale, short in the sperm and rorqual, and extremely long in the humpback. In all cases the pectoral fin has a skeletion of some whales includes certa

Whale is extended, nearly always with a qualifying word, to most of the odontocete or toothed cetaceans, and especially to those of great size, as the sperm-whale, but slso to some of the smallest, no larger than a dolphin, as the pygmy or porpoise sperm-whales of the genus Kopia, and to various forms of intermediate sizes, as the pilot-whales (Blobiesphales), the bottle-nosed or bottle-headed whales (Hyperoódon), the white whales (Delphinapterus), etc. Some of these whales also have distinctive names into which whale does not enter, as blackfish, beluga, bottlehead, bottlehose, grampus, killer, etc., or they share the qualified names porpose and dolphin with various small cetaceans more properly so called. The genera and species of the toothed whales are much more numerous than those of the baleen whales; their synonymy is very extensive and intricate, and is in some cases in a state of confusion which ean only be cleared up by future research. (c) In geologic time whales date back to the Eocene; and a suborder Archeoceti (contrasted with Odontoceti and Mysticete) has been named to cover certain forms atill only imperfectly known from fragmentary remains. (See Zeuglodon.) The oldest whales like any of the living forms date from the late Eocene, and are toothed whales related to the humpbacks. Whalebone whales are not known to be older than the Pliocenc. (d) In present geographical distribution whales are found in all seas, and some of them enter rivers. Most of the species are individually wide-ranging on the high seas, and attempts which have been made to discriminate similar forms from different waters have in most cases proved futile. Several of the larger forms have been the objects of systematic fisheries for centuries. (See thale-fisher.) The principal products are oil, both train and sperm, baleen or whalebone, spermaceti, and ambergris; the hide of some of the smaller whales affords a leather. Whales are exclusively carnivorous, and feed for the most part upon a great variety of small animals which flo

ordinal group—from 4 to about 80 feet in linear dimension. The size of the larger whales has been grossly exaggerated in many of the accounts which find popular credence. Adult right whales of different species range from 20 to 50 feet in length, only the polar whale attaining the latter dimension; the common humpback is from 40 to 50 feet long; the sperm-whale reaches 60 feet; and the rorquals of several species range from 40 to 80 feet, the maximum length being reached only by the blue rorqual, which is the largest of known animals.—Arctic Whale, the polar whale, Baleana mysticettis; that right while which is of circumpolar distribution, as distinguished from any such whale of temperate North Atlantic or North Pacific waters, or from which the latter are sought to be distinguished, as the Atlantic, Pacife, northnest, or Biscay whale.—Atlantic waters. Right whales inhabit all known seas, and those of the main divisions of the waters of the globe have been specified by name, as the arctic, polar, or Greenland right whale, the Atlantic, the Pacific, the southern, the northwest, etc. These have received several technical names, as B. mysticetus of the North Pacific, E. autipodarum of Internation of the North Pacific, B. autipodarum of the South Pacific, and others. It is not likely that more than two valid species are represented in this synonymy: (a) E. mysticetus is of circumpolar di

tween the base of the flipper and the corner of the mouth. The profile of the mouth is strongly arched, and its capacity is enormous, exceeding that of the thorax and abdomen together. This cavern is fringed on each side with baleen hanging from the upper jaw; the plates are 350 to 400 on each side, the longest attaining a length of 10 or 12 feet; they are black in color, and finely frayed out along the inner edge into a fringe of long clastic filaments. When the jaws are closed, the baleen serves as a sieve to strain out the multitudes of small mollusks or crustaceans upon which the whale feeds, and which are gulped in with many barrels of water in the act of grazing the surface with open mouth. About 300 of the slabs on each side are merchantable, representing 15 hundredweight of hone from a whale of average size, which yields also 15 tons of oil; but some large individuals render nearly twice as much of both these products. (b) The southern light whale, B. australis, differs from the polar whale in its proportionately shorter and smaller head, greater convexity of the arch of the month, shorter baleen, and more numerous vertebræ. It inhabits both Atlantie and Pacific Oceans in temperate latitudes, and in the former waters was the object of a fishery during the middle ages for the European supply of oil and bone. This industry gave way to the percent and the strain of the polar whale about the beginning of

the seventeenth century. This whale has long been rare in the North Atlantic, but has occasionally stranded on the European coast, and more frequently on that of the United States. A similar if not identical right whale is hunted in temperate North Pacific waters. Right whales are rare and not pursued in tropical seas, but are objects of the chase in various parts of the south temperate ocean. forming a series of thin parallel plates from a few inches to several feet long; baleen (which see). The term is misleading, for the substance is in no sense bone, but a kind of horn; and its trade-name whale-fin is equally inaccurate, for it has nothing to do with the fins of the whale. Whalebone grows in several hundred close-set parallel plates along each side of the upper jaw of the baleen whale, and thus In the situation occupied by the teeth of ordinary mammals; it is entirely shut in by the lips when the mouth is closed. Each one of the plates of both rows then bends with a strong sweep backward, and when the mouth is opened straightens out, so that there is always a heavy fringe on each side of the eavity of the mouth, forming an impassable barrier to the multitudinous small creatures which the whale seoops in from the surface of the sea. The longest baleen plates are those of the polar whale, some of which may exceed 12 feet in length. The plates in different species differ in color from a dull grayish black through various streaked or veined colorations to somewhat creamy white. Whalebone stands quite alone among animal substances in a particular combination of lightness, toughness, flexibility, elasticity, and durability, together with such a cleavage (due to the straightness of its parallel fibers) that it may be split for its whole length to any desired thinness of strips. A sulphur-bottom whale has yielded 800 pounds of baleen, of which the longest plates were 4 feet in length. In the California gray whale the longest bone is from 14 to 16 inches, of a light lead-color streaked with black, attaining a length of 2 feet 4 inches and a width of from 12 to 14 inches, with a fine fringe from 2 to 4 inches long; it is somewhat ridged crosswise. That of the sharp-headed finner is entirely white, with a short thin fringe; it has been found to consist of 270 pairs of plates, the longest being 10 inches in length. Whalebone is or has been used in the manufacture of a great veriety of articles.

whale-oil (hwāl'eil), n. The eil obtained from the blubber of a whale or other cetaeean. (a) Common oil, or train-oil, is that procured from the blubber of any baleen whale; it has a rank odor, and varies in color from honey-yellow to dark brown, according to the character of the blubber and the method of trying-out. It includes several chemically different substances, the more solidifiable of which may be extracted under pressure and cold, and constitute whale-tallow, the fluid residuum being called pressed oil. (b) Sperm-oil or spermaceti-oil is obtained from the sperm-whale and other toothed cetaeeans. That from the head of the whale contains the spermaceti, which is deposited at ordinary temperatures on extraction from the anilmsl, leaving the liquid oil, of a clear yellow color. (See spermaceti.) Sperm-oil when refined is much used as a lubricant for delicate machinery, and that from various cetaeeans is often named from them, as grampus-oil, porpoise-oil, etc.—Black whale-oil. The origin of the plant grain, the product of species of Triticum, chichy of T. satirum (T. vulgare). The origin of the plant is not clearly known, but it is thought by many to be derived from a grass, Egilops ocata, of the Mediterranean region, now classed as a species of Triticum. The wheatplant is a grass closely related to barley and rye, having a dense four-sided spike, and grains longitudinally turowed on one side, turgid on the other. In some varieties the palets bear awns, in others not, the varieties being respectively called bearded and beardless or latd. Some are planted in the spring—spring or summer wheat—others in the fall, maturing the next season—

albuminoids, together with small quantities of the mineral substances, potash, soda, etc., required by the animal system, with only 14 per cent, of water. For use it is ciblefly converted into flour; the finest but not the most nutritious flour is nearest pure starch. The richer elements lie nearest the skin, and these sers secured in "Graham" flour, which properly includes the whole grain, and by recent milling processes which appropriate all but the cuticle. Wheat was formerly made in England into a dish called frumenty or furnenty, by holling it entire in milk, and seasoning. It is now largely used in America in the form of cracked, crushed, or rolled wheat, or wheat-grits. Wheat has been known from antiquity, being mentioned in Scripture; it is traceable to ancient Egypt, and is recorded as introduced into China about 2700 B. C. It now furnishes the principal breadstuff among all civilized nations. It is adaptable to various conditions and widely grown in temperate regions; it is not excluded by cold winters, but requires a mean summer temperature of not less than 57°. Among the principal countries which produce a surplus are the l'nited Stafes, Canada, Russia, Hungary, India, Australia, Egypt, Rumania, and Turkey. The varietics are very numerous, and there are several more or less strongly marked races, one of which is spelt. is spelt.

2. [cap.] A member of one of the two great political parties of Great Britain, the other being litical parties of Great Britain, the other being the Tories (later the Conservatives). The Whigs were the successors of the Roundheads of the Civil War and the Country party of the Restoration. The name was given to them about 1679 as a reproach by their opponents, the Court party, through a desire to confound them with the rebel Whigs of Scotland (see whigh, 1). The Whigs favored the Revolution of 1683-9, and governed Great Britain for a long period in the eighteenth century. In general, they may be called the party of progress; one of their principal achievements was the passage of the Reform Bill in 1832. About the same time the name Whig began to be replaced by Liberal, though still retained to denote the more conservative members of the Liberal party. See Liberal, Tory.

The south-west counties of Scotland have seldom corn

The south-west counties of Scotland have seldom corn enough to serve them round the year: And . . . those in the west come in the summer to buy at Leith the stores that come from the north: And from a word, Whiggam, used in driving their horses, all that drove were called the Whiggamors, and shorter the Whigs. Now in that year,

after the news came down of Duke Hamilton's defeat, the after the news came down of Duke Hamilton's defeat, the Ministers animated their people to rise, and march to Edinburgh. And they came up marching on the head of their parishes, with an unheard-of fury, praying and preaching all the way as they came. The Marquis of Argile and his party came and headed them, they being about 6,000. This was called the Whiggamor's inroad. And ever after that all that opposed the Court came in contempt to be called Whiggs. And from Scotland the word was brought into Eugland, where it is now one of our unhappy terms of distinction.

Bp. Burnet, flist, Own Times, I. 58.

I hate a Whig so much that I'll throw my Husband out of his Election, or throw myself out of the World! a Parcel of canting Rogues; they have slways Moderation in their Mouths—rank Resistance in their Hearts—and hate Obedience even to their lawful Wives.

Mrs. Centlivre, Gotham Election, i. 1.

The prejudice of the Whiy is for establishment; the prejudice of the Whiy is for innovation. A Tory does not wish to give more real power to Government, but that Government should have more reverence. Then they differ as to the Church. The Tory is not for giving more legal power to the Clergy, but wishes they should have a considerable influence, founded on the opinion of mankind; the Whig is for limiting and watching them with a narrow jealousy.

Johnson, in Boswell, an. 1781.

3. [cap.] In Amer. hist.: (a) A member of the patriotic party during the revolutionary period.

The Hessians and other foreigners, looking upon that as the right of war, plunder wherever they go, from both Whigs and Tories, without distinction.

Robert Morris, Dec. 21, 1776, quoted in Lecky's Eng. in [18th Cent., xiv.]

(b) One of a political party in the United States which grew up, in opposition to the Democratic party, out of the National Republican party. It was first called the Whig party in 1834. Its original principles were extension of nationalizing tendencies, and support of the United States Bank, of a protective tariff, and of a system of internal improvements at national expense. It won the presidential elections of 1840 and 1848, but soon after divided upon the slavery question. It lost its last national election in 1852, and soon after many of its members became temporarily members of the American and Constitutional Union parties, but eventually most of its northern members became Republicans, most of its northern members became Republicans, most of its northern members became Republicans, most of its outleten members between the ventually most of its northern Whigs who were indisposed to regard the compromise of 1850 as a final settlement of the slavery question: so called from their conscientious objections to such compromises with slavery.—Cotton-Whitg, in U. S. hiet., in the last days of the Whig party, one of those northern Whigs who were disposed to regard the compromise of 1850 as a final settlement of the slavery question: so called from their supposed partiality to the cotton interest.

whippoorwill (hwip'pör-wil'), n. [Formerly also whippowill (cf. poor-will); an imitative word, from the sound or cry made by the bird, as if 'whip poor Will.'] An American caprimulgine bird, Autrostomus vociferus, related to the chuck-will's-widow, A. carolineusis, and resembles the best of the chuck-will's-widow. bling the European goatsucker, Caprimulgus curopeus. It is 9 to 10 inches long, and 16 to 18 in extent of wings (being thus much smaller than the chuck-

Whippeorwill (Antrostomus vociferus)

will's-widow), and lacks the lateral filaments of the rictal bristles. The coloration is intimately variegated with gray, black, white, and tawny, giving a prevailing gray or neutral tone, somewhat frosted or hoary in high-plumaged males, ordinarily more brownish; there are sharp black streaks on the head and back; the wings and their coverts

whip-snake

are barred with rufous spots; the lateral tail-feathers are black, with a large terminal area white in the male, tawny in the female; and there is a throat-bar white in the male, tawny in the female. The bill is extremely small, but the mouth is deeply eleft, and as wide from one corner to the other as the whole length of the rictus (as figured under jssirostral). There has been some popular confusion between the whippoorwill and the night-hawk; they are not only distinct species, but belong to different genera, and their dissimilarity appears at a glance. Unlike the night-hawk, the whippoorwill is entirely noeturnal; it files with noiseless wings, like the owl, and is oftener heard than seen. The notes which have given the name are trisyllable (compare poor-will), and rapidly reiterated, with a strong acceut on the last syllable; a click of the beak and some low muffled sounds may also be heard when the bird is very near. The eggs, two in number, are laid on the ground, or on a fallen log or stump, without any nest; they are creamy-white, heavily clonded and marked with brown and neutral tints, nearly equal-ended, and 1.25 by 0.90 inch in size. The young are covered with fluffy down. The whippoorwill inhabits the eastern half of the United States and British provinces; it breeds nearly throughout its range, but winters extralimitally. A western variety is sometimes specified as the Arizona whippoorcill; but the place of whippomrwills is mostly taken in the west by the poor-wills, as Nuttall's. Several other species of Antrostomas are found in Mexico and Central and South America.

The change from whisk², a word of no very obvious significance after its first application, was prob. orig. accidental, or due to an unthinking conformity to whist¹. The notion that the game was called whist "because the parties playing have to be whist or silent," etymologically improbable in itself, is based on the erroneous assumption that whist is the orig. name. The rule of silence, so far as it exists, is appar. founded, however, in part on the false etymology.] A game played with eards by four persons, two of them as partners in opposition to whist2 (hwist), n. assumption that whist is the orig, name. The rule of silence, so far as it exists, is appar. founded, however, in part on the false etymology.] A game played with eards by four persons, two of them as partners in opposition to the other two, also partners. Partnership is determined by agreement or by cutting: if by agreement, two players, one on each side, cut for deal; if by entting, the two who cut the lowest eards are partners, and the original deal belongs to the player who cuts the lowest eard. The ace is the lowest eard in entting. Previous to play, the cards (a full pack) are shuffled. The player on the right of the dealer cuts, and the dealer, beginning with the players on his left, distributes in regular order to all the players, one at a time, the cards face downward, except the last card, which be turns face upward upon the table, at his right hand, where it must remain until his turn to play. This is the trump eard, and the suit to which it belongs is the trump suit; the other three suits are plain suits. The leader is the dealer's left-hand player, who he genistle play by throwing one of his thirteen eards face upward upon the center of the table. Second hand, the leader's left-hand player, who will be active the same suit if he holds one; if he does not hold one, with a card of the same suit if he holds one; if he does not hold one, with a card of the same suit if he holds one; if he does not hold one, with a card of the highest trump played takes the trick. The trick is gathered by the partner of the winner; the four eards are made by him into a packet, and placed face downward, at his left hand, on the table. The winner becomes the leader, and the routine is continued until sil the eards held are played. Tricks above six in number count a point each upon the score. The score is the record kept of the number of points made. In play the ace is highest, the king, queen, knave, 10, and are also high cards, the 8 is the middle card, and the 7 to the 2 inclusive are lowestrals. The rank of the eards a

minous color, devoid of chroma, and therefore indeterminate in hue. But a white intensely illuminated has a yellow effect, and very deeply shaded takes on the bluish look of gray. A derangement of the proportions of light in pure white to the extent of 3 per cent. of the red, 6 per cent. of the green, or .5 per cent. of the blue, is readily perceived by direct comparison; but quite considerable admixtures of chroma are compatible with the color's retaining the name of white.

white-bait (hwīt'bāt), n. 1. A small clupeoid fish, prized as a delicacy in England. Whitebait are best when from 2 or 3 inches long, but retain the name up to a size of 4 or 5 inches. They abound in the estuary of the Thames and in other similar British localities at certain acasons. The fishing begins in April, and lasts through the summer; the fishes are taken in bag-nets. They are chiefly of a silvery-white color inclining to a pale-greenish on the back. Some places in England, as especially Greenwich, are famous for their whitebait dinners. The fish are usually fried till they are crisp. The identity of whitebait has been much discussed and disputed. They have been supposed to be a distinct species, named Clupea alba, and even placed in a genua framed for their reception as Rogenia alba. They have been more generally recognized as the fry of certain elupeoids, as the sprat (Clupea sprattus), the herring (C. harengus), and the shad (of one or another of the British species). But careful examinations of great quantities of whitebait, made in different localities at different times, have shown these conjuins to the more or less erroneous. Whitebait gus), and the shad (of one or another of the British species), But careful examinations of great quantities of whitebait, made in different localities at different times, have shown these opinions to be more or less erroncous. Whitebait consists in fact of the fry of several different chipcoid fishes, mainly the sprat and the herring, with occasionally a small percentage of yet other fishes; and the relative quantity of the different species represented varies, moreover, according to season and locality.

White's thrush. A ground-thrush, Geoeichla (Orecoeincla) varia. This bird was originally described as Turdus varius by Pallas, 1811; as T. aureus by Holandre, 1828; and as T. white by Eyton, 1836, when it was found as a straggler to Great Britain, and dedicated to G. White of Selborne; it is also known as Orecoincla aurea, O. whitei, and by other names. By some singular misapprehension White's thrush has been said to be "the only known bird which is found in Europe and America and Austrial ailke"—the facts being (1) that various birds are so found, but no thrushes of any kind are so found; (2) that White's thrush has never been found either in America or in Australia, and has been found in Europe as an accidental visitant only, its habitat being as given under ground-thrush (which see); (3) that the supposed White's thrush of Australia is G. lunudata (Turdus lunudatus of Latham), and the true White's thrush, occurring as a straggler in Europe, was mistakenly recorded as Turdus lunulatus by Blasius in 1862: whence a part of the myth, which in its rounded-out form extended to America.

Whittleseya (hwit'l-si-a), n. [Named after C. Whittlesey (see def.).] The generic name of a plant first found by Charles Whittlesey in the coal-measures at Chyahoga Falls, Ohio, in the eoal-measures at Chyahoga Falls, Ohio, and named by J. S. Newberry in honor of its discoverer (1853). This plant is known only by Its leaves, of which the nervation is very peculiar, excluding it from all other known genera. The generic characters, as given by Lesquereux, are—"frond simple or pinnate, nerves fasciculate, confluent to the base, not dichotomous, fructification unknown." The leaves have a peculiar truncate form, are somewhat fan-like in shape, and dentate at the upper border, but entire on the sides and rapidly narrowing into a short petiole. This plant, of which the nervation has some analogy with that of the gingko, was placed by Lesquereux with the Noeggarathieer; Schenk considers it as possibly belonging to the gymnosperms. Whittleseya has been found in various localities, always low down in the coal-measures.

=Syn. Who, which, and that agree in being relatives, and are more or less interchangeable as such; but who is used chiefly of persons (though also often of the higher animals), which almost only of animals and things (in old English also of persons), and that indifferently of either, except after a preposition, where only who or which can stand. Some recent authorities teach that only that should be used when the relative clause is limiting or defining; as, the man that runs fastest wins the race; but who or which when it is descriptive or coordinating; as, this man, who run fastest, won the race; but, though present usage is perhaps tending in the direction of such a distinction, it neither has been nor is a rule of English speech, nor is it likely to become one, especially on account of the impossibility of setting that after a preposition; for to turn all relative clauses into the form "the house that Jack lived in" (instead of "the house in which Jack lived in" (instead of "the house in which Jack lived in" (instead of "the house in which Jack lived in" that where the shove), by never taking a comma before it, whether it be who or which or that. Wherever that could be properly used, but only there, the relative may be, and very often 1s, omitted altogether; thus, the house Jack built or lived in; the man (or the purpose) be built it for. The adjective clause introduced by a relative may qualify a noun in any way in which an adjective or aljective phrase, either attributive or appositional, can qualify it, and has sometimes a pregnant implication of one or another kind; as, why pinish this man, who is innocent? i. e. seeing, or although, he is innocent (= this innocent man). But a relative is also not rarely made use of to add a coordinate statement, being equivalent to and with a following pronoun; as, I studied geometry, which I found difficult (and [17] found it difficult; I met a friend, who kindly showed me the wa

herge, f., a prostitute; OBulg. kurŭva = Pol. kurwa = Lith. kurva, adulteress (perhaps < abuse.

Teut.). Some compare Ir. caraim, love, vara, friend, L. eārus, dear, orig. loving (see caress), Skt. ehāru, agreeable, beautiful, etc.

The word was eonfused or homiletically associated in early ME. with ME. hore, < AŠ. horu (hore-) = OŠ. horu, horo = OFries. hore = OHG. horo, filth, dirt. By some modern writers it has been erroneously derived from hirel, as if 'one hired,' the notion really present in the equiv. L. meretrix, a prostitute (see meretrix).

The vowel in this word was orig. long, and the reg. mod. form would be *hoor (hör), the pron. hôr instead of hör (as given by Walker beside hör) is prob. due to the eonfusion with beside hor) is prob. due to the confusion with the ME. hore, filth, and to the later confusion of the initial ho- with who-, as also in whole. The word, with its derivatives, is now avoided in polite speech; its survival in literature, so far as it survives, is due to the fact that it is a favorite word with Shakspere (who uses it, with its derivatives, 99 times) and is common in the authorized English version of the Bible. The word in all its forms (whoredom, etc.) is generally retained in the revised version of the Old Testament, though the American revisers recommended the substitution of harlot, as less gross; in the revised version of the New Testament harlot (with fornicator for whoremonger, etc.) is substituted.] A woman who prostitutes her body for hire; a prostitute; a harlot; a courtezan; a strumpet; hence, in abuse, any unchaste woman; an adulteress or fornicatress. [Now only in low use.]

See swath!—To give a wide berth to. See berth? 1.—Wide-angle lens. See lens.—Syn. Wide, Broad, spacious, large, ample. Wide and broad may be synonymous, but broad is generally the larger and more emphatic: a wide river is not thought of as so far across as a broad river. Wide is sometimes more applicable to that which is to be passed through: as, a wide mouth or aperture. It is another way of stating this fact to say that wide has more in mind than broad the limiting sides of the thing. Wide is also more generally applicable to that of which the length is much greater than the width, but not to the exclusion of broad. Each may in a secondary sense be used of length and breadth: as, broad acres; a wide domain.

Widmannstättian (wid-man-stet'i-an), a. Pertaining to Aloys Beek von Widmannstätt, of Vienua (1753-1849).—Widmannstättian figures, the name given to certain peculiar markings seen on the polished surfaces of many meteoric trons (siderolites) when these have been acted on by an acid. They were first noticed by Widmannstätt in 1808, on the Agram meteorite. The general appearance of these markings may be learned from the annexed figure, which is a copy of a photograph, of natural size, of a part of an etched section of the Laurens county (South Carolina) meteoric from. The Widmannstättian figures are sections of planes of cleavage or of crystalline growth, along which segregation, or chemical change of some sort, has taken place, and whose form and position with reference to each other are in secondance with the laws governing the development of crystalline substances belonging to the isometric system. Reichenbach divided these figures into what he Widmannstättian (wid-man-stet'i-an), a. Per-

called a trias (more properly a triad)—namely, kamacite (Balkeneisen), thenite (Bandeisen), and plessite (Full-tesen)—the first consisting, so far as has been as yet made out, of distinct plates of fron, with a comparatively small percentage of nickel; the second consisting of thinmer plates enveloping the kamacite, and richer in nickel; and the third being a sort of ground-mass filling the cavities, and having less obvious indications of structure and generally a darker color than the others. It has frequently been stated that some meteoric frons do not exhibit the Widmannstattian figures, and that consequently their absence is not a proof of non-celestial origin; it is certain, however, that few, if any, siderolites do not show traces of some kind of structure, although investigators in this hranch of science are by no means agreed as to what kind of figures are properly designated by the name Widmannstattian. A somewhat similar uncertainty prevails with regard to the figures developed by etching on the terrestrial iron of Ovifak; so that, at the present time, it cannot be said that the Widmannstattin figures furnish a positive criterion by which the authenticity of a meteoric iron may be established; yet it is certain that well-developed figures of this kind do render it highly probable that the specimen in which they are seen is extractrestrial. A classification of meteoric irons on the basis of the different forms of figures which they exhibit, in the present condition of this branch of science, does not seem to be justifiable, although this has been attempted.

4. Expressed wish with regard to the disposal s property, or the like, after death; the document containing such expression of one's wishes; especially, in law, the legal declaration of a person's intentions, to take effect after his death. The essential distinction between a will and any other instrument or provision contingent upon death is that a will has no effect whatever until death, and may be freely revoked meanwhile; but a deed which may create or convey an estate in the event of death must take effect as binding the grantor in his life-time. In English law the word will was originally used only of a disposition of real property to take effect at death, the word testament heing then used, as in the Roman and civil law, of a disposition of personal property; hence the phrsae, now redundant, last will and testament. In modern usage the term will does not necessarily imply an actual disposition of property; for an instrument, executed with the formalities required by law, in which the testator merely appoints a guardian for his child, or merely nomlnates an executor, leaving the assets to be distributed by the executor among those who would take by law, is a will. In respect of form, that which distinguishes a written will from other instruments consists in the ceremonies which the law requires for a valid execution, for the sake of guarding against mistake, fraud, and undue influence. Nuncupative wills, however, are not subject to these rulea. These formalities are generally four: (1) The testator must subscribe at the end or foot of the writing. (2) He must do so in the presence of witnesses. In some jurisdictions tire are required. In some jurisdictions three are required. In some jurisdictions a seal is necessary with the testator's signature. One whose testimony as a subscribing witness becomes necessary to prove it can take no gift by the will.

6. The faculty of conscious, and especially of deliberate, action. The will should not be confused (as it is, however, by different writers) with self-control, desire, choice, or attention, although the first and last of these are special modes of volition. Nor is "willing" a table to move automatically across a room an act of will; for experiment shows that effort of this kind, however strenuous, fails to cause even the willer's own hand or foot to move. Normally, the consciousness of action is merged in sensations coming from the member moved; but in cases of anæsthesia the agent is still aware of being in action, and even more or less of what he is doing. This consciousness always involves a sense of opposition, whether in the form of a struggle or of a triumph, or in the negative aspect of a sense of freedom. (See freedom of the will, below.) We are always aware of some resistance, be it only the inertia of our limbs. Willing thus essentially involves perceptive sensation, the reflexio of Thomas Aquinas. (See reflection, 7.) When the read object with which we are in relation is studied with reference to the predicates attributed to it by the senses, the result is experience; but when the predicates we are inwardly inclined to attach to it are studied out, the operation is deliberation, terminating in choice, and commonly followed by acts of will. This cognitive process is the necessary condition of self-control. By a "strong will" is sometimes, and perhaps most correctly, meant great self-control; but more usually a power of bearing down the wills of others by triing them out and by a domination like hypnotism is intended.

Appetite is the Will's solicitor, and the Will is Appetite's controller; what we covet according to the one by the other we often reject.

Hooker, Eccles. Polity, I. viil. § 3. Every man is conscious of a power to determine in things which he conceives to depend upon his determination. To this power we give the name of will.

Reid, Intellectual Powers, ii. 1.

7. The act of willing; the act of determining a choice or forming a purpose; volition.

Even actual sins, committed without will, Are neither sins nor shame—much more compell'd. Fletcher (and another), Queen of Corinth, iii. 2.

It is necessary to form a distinct notion of what is meant by the word Volition in order to understand the import of the word Will, for this last word properly expresses that power of the mind of which volition is the act. . The word will, however, is not always used in this its proper acceptation, but is frequently substituted for volition, as when I say that my hand moves in obedience to my will.

Conjoint will, joint will, mutual wills, legal phrases often used without much discrimination. Especially—(a) A testamentary act by two persons jointly uniting in the same instrument, as their will, to take effect after the death of both. (b) A similar instrument to take effect as to each on his or her death. These two classes are more properly termed joint or conjoint. (c) Wills made in connection by two persons pursuant to a compact, binding each to the other to make the dispositions of property thus declared. (d) Wills made to bequeath the effects of the one first dying to the survivor. These two classes, and particularly the last, are more appropriately termed mutual. The legal effect of such wills is often a matter of doubt.—Factum of a will. See factum.—Freedom of the will, a mental attribute the existence of which is disputed. The phrase is taken in different senses by different thinkers. (a) The power of doing right on all occasions. (b) That freedom of which we have an immediate consciousness in action. This is, however, only the consciousness of being able to overcome some unspecified resistance to some unspecified extent, which implies and is implied in the fact of resistance, and is in fact but an aspect of the scuse of action and reaction. (c) The power of acting from an inward spontaneity, not altogether dominated by motives. This is what most of the metaphysical advocates of the freedom of the will specifically contend for. It is a limitation of the action of causality, even in the material world. Some would restrict the spontaneous power of the mind to making particles swerve without variation of their vis viva; but this is untenable, since the law of action and reaction, which would thus be vitiated, is far more securely proved than that of the conservation of energy, the evidence for which simperfect, while the objections to it are weighty.

Certsinly there be that delight in giddiness, and count it a boudage to fix a belief—affecting free will in thinking, as well as in acting.

Bacon, Truth (ed. 1887).

We thus, in thought, never escape determination and necessity. It will be observed that 1 do not consider this inability to the notion any disproof of the lact of free-will.

7. To haul or hoist by or as by a winch, whim, eapstan, or the like: as, to wind or warp a ship out of harbor; specifically, in mining, to raise (the produce of the mine) to the surface by (the produce of the mino) to the surface by means of a winding-engine; hoist. The term wind, as well as draw, is often employed in Great Britain, while hoist is generally used in the United States. In the early days of mining, ore and coal were almost exclusively raised by hand, horse, or steam-power, in buckets or kibbles; at the present time, in both England and the United States, this is done by means of a winding-engine which turns a drum on which a rope (generally of steel wire) is wound and unwound, and by means of which a cage (see cage, 3(d)) is raised or lowered, on which the loaded cars are lifted to the surface, and the empties returned to the pit-bottom. The dimensions of engines, drums, and cages in large mines are sometimes very great, as is also the velocity with which the machinery is moved. Thus, in the Monkwearmouth colliery, Durham, England, the windlug-drums are 25 feet in diameter, the rope weighs 4½ tons, the eage and load 7½ tons; the vertical distance through which the cage is raised is 5-0 yards, and the time occupied in lifting it and discharging the cars is two minutes and four seconds.

From the E. wind, besides the verb and the obvious derivatives or compounds, are derived window, winnow, etc.; from the L. are ult. E. vent², ventilate, ventose, etc. (see also vent¹).] Air naturally in motion at the earth's sur face with any degree of veloeity; a current of air as eoming from a particular direction. When the air has only a slight motion, it is called a breeze; when its velocity is greater, a fresh breeze; and when it is violent, a gale, storm, or hurricane. The nitimate cause of winds is to be found in differences of atmospheric density produced by the sun in its unequal heating of different parts of the earth. These original differences of density give rise to vertical and horizontal currents of air which constitute and establish the general atmospheric circulation, and determine permanent belts of relatively high and low pressure over the earth's surface. Differences of pressure, in turn, produce their own differences of density at the earth's surface, and thereby become a secondary cause of winds. The general system of atmospheric circulation, with respect both to surface-winds and to their correlative upper currents, is described under trade-wind. In accordance with the character of their exciting cause, winds may be divided into —(1) constant, the trade-winds and anti-trade winds, which depend upon the permanent difference of temperature between the equatorial regions and higher latitudes; (2) periodic, the monsoons, and land- and sea; (3) cyclonic and anticyclonic, winds associated with or constituting progressive areas of high and low pressure, the ultimate origin of which, especially of those in high latitudes, is not satisfactorily determined; (4) whirlwinds and (certain) squalls, which arise when the air is in a condition of unstable equilibrium, and are developed as a part of the process by which stability is regained (this class includes the most violent winds, such as the tornado), and these occur when the instability is the combined effect of a high temperature and a high humidity, a condition favorable to the development of the greatest possible gradients of density, and hence of the most terrific manifestations of wind; (5) special, winds which logically belong to the preceding classes, but which by re face with any degree of velocity; a current of air as coming from a particular direction. Leading wind. See leading!.—Mountain and valley winds, in meteor, diurnal winds blowing up the sides of mountains and the trough of valleys during the day, and down during the night. They are due to differences of temperature arising from unequal heating and radiation, whereby the air at the summits of hills and mountains is heated during the day to a higher temperature than the air at the same level over the valleys or lowlands, causing a current up the valleys and mountain-sides; conversely, during the night the air at the summit is cooled by radiation to a lower temperature than the air at the same level over the lowlands, causing a downward surface flow of cold air. In narrow valleys this current sometimes attains great strength, as in the case of the Wisper wind of the Rhine.—North wind of California, a dry, desiccating north wind experienced on the Pacific slope of the United States, but especially in the Sacramento and San Joaquin valleys of California. wind-instrument (wind'in strö-ment), n. A musical instrument the sound of which is produced by a stream of compressed air, usually by the breath. Chief of such instruments is the human voice. Wind-instruments blown by the breath are divided into two classes: vood vind-instruments, including the flute, flageolet, ohee, clarinet, bassoon, English horn, etc.; and brass or metal wind-instruments, including the trumpet, horn, trombone, tuba, ophicleide, etc. Wind-instruments sounded by air mechanically compressed include the pipeorgan and the reed-organ, together with the bagpipe, and, in a certain sense, the Æolian harp. The method of tone-production in all these instruments, except the last, is either the vibration induced in a stream of air by directing it against a sharp edge, as in the flute and in flue-pipes in the organ, or the vibration induced in an elastic tongne or reed in or over an orifice through which a stream of air is driven, as in the voice, the clarinet, and the reedorgan. Sometimes both methods are used in the same instrument, as in the pipe-organ. duced by a stream of compressed air, usually

a rope or chain for raising the weight by being wound round the axle. A simple form of windlass, much used in ships for raising the anchors or obtaining a purchase on other occasions, consists of a strong beam of wood placed horizontally, and supported at its ends by iron spindles which turn in collars or bushes inserted in what are termed the windlass built around a spindle which is journaled in the checks d, d. The pawls are termed the windlass built around a spindle which is journaled in the checks d, d. The pawls are pivoted in the pawl-bits, e, and sustain the strain while the handspikes, which rotate the windlass by being placed like spokes in the holes of the drumheads, are being shifted for any purchase is required. It is furnished with pawls to prevent it from turning backward when the pressure on the handspikes is intermitted. Different arrangements of gearing are applied to a windlass to exert increased power, and steam-windlasses, in which a small steamengine is made to heave the windlass round, have come largely into use. Compare capstan (with cut), and cut under winch.

A mill or machine for grinding, pumping, or other purposes, moved by the wind; a wind-motor; any form of mo-tor for utilizing the pressure of the wind as a motive power. Two types of machines are used, the horizontal and the vertical. The vertical motor consists essentially of a horizontal shaft called the wind-shaft, with a combination of sails or vanes fixed at the end of the shaft, and suitable gearing for conveying the motion of the wind-shaft to the pump or other machinery. The older types of windmill used four vanes or sail-frames called whips, covered with canvas, arrangements being provided for reefing the sails in high winds. To present the vanes to the wind, the whole structure or tower carrying the windmill was at first turned round by means of a long lever. Later the top of the tower, called the cap, was made movable. Windmills are now made with many wooden yanes forming a disk exposed sure of the wind as a mo-

er, called the cap, was made movable. Windmills are now made with many wooden vanes forming a disk exposed to the winds, and fitted with automatic feathering and steering machinery, governors for regulating the speed, apparatus for elosing the vanes in storms, etc. These improved windmills are chiefly of American invention, and are largely used in all parts of

E. vine, vignette, vinous, vinegar, vintage, vinture, etc.] 1. The fermented juice of the grape or fruit of the vine, Vitis. See Vilis. Wines are distinguished practically by their color, their hardness or softness ou the palate, their flavor, and their being still or effervescing. The differences in the quality of wines depend upon differences in the varieties of vine, and quite as much on the differences of the soils in which the vines are planted, in the exposure of the vineyards, in the treatment of the grapes, and in the mode of manufacturing the wines. When the grapes are just fully ripe, the wine is generally most perfect as regards strength and flavor. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its Intoxicating powers principally depend. The amount of alcohol in the stronger ports and sherries as found in the market is from 16 to 25 per cent.; in hock, claret, and other light wines, from 7 per cent. Wine containing more than 13 per cent. of alcohol may be assumed to be fortified with brandy or other spirit. Among the most celebrated ancient wines were those of Lesbos and Chios of the Greeks, and the Falernian and Ceeuban of the Romans. Among the principal modern wines are port, sherry, Bordeaux, Burgundy, champagne, Madeira, Rhine, Mosselle, Tokay, and Marsala. The principal wine-producing countries are France, Germany, Spain, Portugal, Italy, Austria-Ilungary, Greece, Cape Colony, Australia, and the United States.

Such a limb, in nearly all birds, is serviceable for aerial flight; in a few hirds, as dippers, which fly through the air, also for swimming under water; in some, as penguins, only for swimming in which case the wing is flipper-like of finding; in some, as the ostrich, it serves only as an aid in running; in some, as the emu, cassowary, and apteryx, it is practically functionless; it appears to have been wanting in the moas; it is a weapon of offense and defense in some birds, as the swan, and others in which it is provided with a horny spur; it is terminated with a claw or claws in some birds. The principal feathers of the wing are the remiges, rowers, or flight-feathers, those which are seated upon the hand being the prinaries, those of the thororam secondaries, those of the torarm secondaries, those of the timp hastard quills; the smaller feathers, overlying the bases of the remiges, are collectively known as coverts. (See cut under covert, 6.) The various shapes of birds' wings depend to some extent upon the proportions of the bones, especially those of the pinion (see Macrochives), but mainly upon the development of the terms in technical use are simply descriptive of size, contour, and the like, as long, short, narrow, broad (or ample), pointed, rounded, vaulted, etc., requiring no further explanation. See names of the sets of feathers used above, and phrases helow. (b) In mammal, by the enormous extension of bones of the hand and fingers, npon which, and between which and the body and leg, is stretched an extension of the sea of one of the two lones of the forearm hy extreme reduction of the una. two bones of the forearm by extreme reduction of the ulna. Such is the condition of the forealimh of bats, or Chiroptera, which alone are provided with true wings and eapable of true flight; for the so-called wings of various other mammals described as "flying," as the flying-squirrel, flying-phalanger, etc., are more properly parachutes or patagia, and their flight is only a prolonged leap. See ents

Pteropoditive. (c) In herpet, by a modification of the fore limb comparable to that of a bat's, but peculiar in the enormous extension of an ulnar digit, and its connection with other digits and with the body by an expansion of the integument, as in the extinct flying reptiles, the pterodactyls. (See cut under pterodactyl.) The flying apparatus of certain recent reptiles, as the Draco volans, is a parachute, not a true wing. (d) In ichth., a mere enlargement of the pectoral lins enables some fishes to sustain a kind of flight; and, as the pectoral fins answer to the fore limbs of higher vertebrates, this case comes under the definition of a wing.

2. In cutom, an expansion of the crust of an

2. In cutom., an expansion of the crust of an insect, sufficing for flight, or a homologous expansion, however modified in form or function, or even functionless so far as aërial locomotion is concerned. Such a formation, though a wing by analogy of function with the wing of a vertebrate, is an entirely different structure, having no homology with the fore limb of a vertebrate. It consists of a fold of integrment, supported on a tubular framework of so-called nerves or veins, which may be in communica-

tion with the trachea or breathing-organs, and is consequently a respiratory as well as a locomotory organ. Most insects are provided with functionally developed (thoracic) wings, of which there are usually two pairs (mesothoracic and metathoracic); but both may be entirely sunressed or ally two pairs (mesothoracic and metathoracic); but both may be entirely suppressed, or either pair may be mere rudiments (see cuts under halter³ and Stylops), or the anterior pair may be econverted into a horny ease covering the other pair, as in the great order Coteoptera, where the anterior pair are converted into etylora, and in Orthoptera, in which they become tegmina. (See viny-case.) The form, structure, and disposition of insects wings are very variable, but quite constant in large groups, and therefore a basis of the division of insects into orders, and of their classification: whence the terms Coleoptera, Neuroptera, Lepidoptera, Orthoptera, Diptera, Aptera, etc. See phrases below, and cuts under nervure and venation.

3. In other invertebrates, some part resembling or likened to a wing in form or function; an alate formation, as the expanded lip of a strom-

alate formation, as the expanded lip of a strombus.—4. An organ resembling the wing of a bird, bat, or insect, with which gods, angels, demons, dragons, and a great variety of fabulous beings, as well as some inanimate objects, are conceived to be provided for the purpose of aërial locomotion or as symbolical of the power of omnipresence.

Book of Wisdom of Jesus. See Ecclesiasticus.—Book of Wisdom of Solomon, one of the deuterocanonical books of the Old Testament. (See deuterocanonical and Appertypha.) Tradition sscribes its suthorahip to Solomon; but by most modern Protestant theologians it is sttributed to an Alexandrian Jew of the first or second century B. c. The shorter title Wisdom, or Book of Wisdom, is commonly applied to this book, but not to Ecclesiastiens. Abbreviated Wisd.—Salt of wisdom. Same as sal alembroth (which see, under sail.) =Syn. I. Knowledge, Prudence, Wisdom, Discretion, Providence, Forecast, Provision. Knowledge has several steps, as the perception of facts, the accumulation of facts, and familiarity by experience, but it does not include action, nor the

wise

power of judging what is best in ends to be pursued or in means for attaining those ends. Prudence is sometimes the power of judging what are the hest means for attaining desired ends; it may be a word or action, or it may be simply the power to avoid danger. It implies deliberation and care, whether in acting or refraining from action. Wisdom chooses not only the best means but also the best ends; it is thus far higher than prudence, which may by choosing wrong ends go altogether astray; hence also it is often used in the Bible for piety. As compared with knowledge, it sees more deeply into the heart of things and more broadly and comprehensively sums up relations, draws conclusions, and acts upon them; hence a man may abound in knowledge and be very deficient in wisdom, or he may have a practical wisdom with a comparatively small stock of knowledge. Discretion is the power to judge critically what is correct and proper, sometimes without suggesting action, but more often in view of action proposed or possible. Like prudence the word implies great caution, and takes for granted that a man will not act contary to what he knows. Providence looks much further shead than prudence or discretion, and plans and acts according to what it sees. It may be remarked that provision, which is from the same root as providence and prudence, is primarily a word of action, while they are only secondarily so. Forecast is a grave word for looking carefully forward to the consequences of present situations and decisions; it implies, like all these words except knowledge, that one will act according to what he can make out of the future. See cautious, astute, and genius.
